Abstract

Inverse Limit Reflection and the Structure of $L(V_{\lambda+1})$

by

Doctor of Philosophy in Mathematics

University of California, Berkeley

Professor W. Hugh Woodin, Chair

We explore the technique of inverse limits, a tool first introduced by Laver in the context of rank-into-rank embeddings. We extend reflection results of Laver using inverse limits up to and including embeddings of the form $L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$. Isolating this technique as 'inverse limit reflection,' we use it to prove structural results of $L(V_{\lambda+1})$ very similar to properties of $L(\mathbb{R})$ under $AD^{L(\mathbb{R})}$. We then define a representation, first introduced by Woodin, for subsets of $V_{\lambda+1}$, and prove basic closure properties of this representation. Employing the technique of inverse limit reflection we then prove an important property called the Tower Condition and analyze certain measures generated from fixed points of embeddings to broaden the extent of these representations in $L(V_{\lambda+1})$.

Acknowledgments

I would most of all like to thank my advisor Hugh Woodin for sharing with me his deep knowledge of and insight into mathematics, for showing me the profound project which is set theory, and for teaching me what it is to be a mathematician. I am indebted to Vincenzo Dimonte, Peter Koellner, Richard Laver, Everett Piper, Xianghui Shi, John Steel, and Nam Trang for numerous discussions, comments, suggestions, and corrections. I would also like to thank my family, Mom, Dad, Brent, and Megan, for their support, and Lynn for her companionship and understanding.
Chapter 1

Introduction

The study of $L(V_{\lambda+1})$ is motivated primarily by the two goals of uncovering the structure of large cardinal axioms just below the limitation of Kunen’s Theorem, and understanding the relationship between $L(V_{\lambda+1})$ and $L(\mathbb{R})$ (see [Lav02] for a survey of the subject). In this manuscript, we develop techniques for solving questions which arise in the first area, and then we use these techniques to further our understanding in the second area.

Large cardinal hierarchy serves as a fundamental measurement of consistency strength in set theory, and the computation of equiconsistency with large cardinals is a fundamental goal in set theory. At the highest reaches of the large cardinal hierarchy, however, there are more basic questions about the structure of large cardinals: first, large cardinal axioms must be identified; second, the relationship between these axioms must be understood; and third, basic justification for their consistency must be given.

For the first task, there is an analogy with models of determinacy which has proven very useful in discovering new axioms. This analogy stems from the similarity between the two structures $L(V_{\lambda+1})$ and $L(\mathbb{R})$, and is potentially a source of deep connections between the two theories. The second task can involve understanding the reflection properties of large cardinals, a subject which we will spend considerable time considering below. The third task might involve showing interesting structural results follow from the axioms. In our case, we will be concerned with how large cardinals affect the structure of $L(V_{\lambda+1})$.

Large cardinal axioms, for our purposes, are generally of the form: there exists a non-trivial elementary embedding $j : V \rightarrow M$, where $M$ has a certain amount of agreement with $V$. Kunen’s Theorem gives an upper bound for such axioms; it states that under ZFC there is no elementary embedding $V \rightarrow V$ (see Section 1.1.1 for more details; we assume all embeddings are non-trivial). Below this axiom, we are concerned with the following general divisions in the large cardinal hierarchy (see Sections 1.1.1 and 5.1.1 for definitions). On the left we indicate whether or not the axioms are potentially consistent with the Axiom of Choice.
Clearly, whether or not it is consistent for such choiceless $V \rightarrow V$ embeddings to exist is a fundamental question at this level, and in order to tackle this question, understanding the structure of the axioms just below this division is likely of paramount importance. Here we take the first step towards such an analysis by studying the structure of $L(V_{\lambda+1})$.

We begin by studying the reflection properties of $L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$ embeddings. The main tool we use is the inverse limit of a sequence of elementary embeddings. Laver ([Lav97], [Lav01]) first introduced inverse limits in the study of reflecting rank into rank embeddings. An inverse limit is an embedding $\bar{V}_{\lambda+1} \rightarrow V_{\lambda+1}$ for some $\bar{\lambda} < \lambda$ which is built out of an $\omega$-sequence of embeddings $V_{\lambda+1} \rightarrow V_{\lambda+1}$ (see Section 2.1). The basic question of inverse limits is to what extent for all $\alpha$ there exists an $\bar{\alpha}$ such that the inverse limit extends to an elementary embedding $L_{\bar{\alpha}}(\bar{V}_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1})$; inverse limit reflection is the statement that an inverse limit does have such an extension as long as the embeddings that make up the inverse limit are sufficiently strong. In Sections 2.2-2.5 we show through several different proofs that inverse limit reflection holds up through the hierarchy of axioms below $L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$ embeddings. As a culmination to this analysis, we show that the existence of an elementary embedding

$$L(V_{\#(\lambda+1)} \rightarrow L(V_{\#(\lambda+1)}$$

with critical point less than $\lambda$ implies that there is some $\bar{\lambda} < \lambda$ such that there is an elementary embedding

$$L(V_{\bar{\lambda}+1}) \rightarrow L(V_{\bar{\lambda}+1})$$

with critical point less than $\bar{\lambda}$.

In Chapter 3, using inverse limit reflection at level $\alpha$ we show a number of structural properties of $L(V_{\lambda+1})$. Let $\Theta$ be the sup of $\beta$ such that there exists a surjection $V_{\lambda+1} \rightarrow \beta$ in $L(V_{\lambda+1})$. In $L(V_{\lambda+1})$, let $\kappa < \Theta$ be a cardinal with cofinality bigger than $\lambda$, let $\alpha < \lambda$ be an infinite cardinal, and let

$$S_{\alpha} = \{\beta < \kappa | \text{cof}(\beta) = \alpha\}.$$ 

Assume there exists an elementary embedding $j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$. Woodin showed that in $L(V_{\lambda+1})$, $\kappa$ is measurable, and this is witnessed by the club filter restricted to a stationary set. However, he also showed that if $\alpha > \omega$ then it is consistent that the club filter restricted to $S_{\alpha}$ is not an ultrafilter. This theorem leaves open the case of $\alpha = \omega$, and we show, under the above assumptions, that $S_{\omega}$ cannot be partitioned into two stationary sets which are in $L(V_{\lambda+1})$. Woodin showed a similar result follows from the existence of $U(j)$-representations (see Chapter 4), but it is unclear at present if all subsets of $V_{\lambda+1}$ in $L(V_{\lambda+1})$ have $U(j)$-representations (see Section 4.4).
Along these same lines, Xianghui Shi and Woodin showed that the Perfect Set Property in $L(V_{\lambda+1})$ follows from a forcing argument and the generic absoluteness of Theorem 4.5.2. In Section 3.2 we prove an analogous result using inverse limit reflection.

This relationship between inverse limit reflection and the structure of $L(V_{\lambda+1})$ has an interesting consequence (see Corollary 2.5.11). Suppose that $X \subseteq V_{\lambda+1}$ and there exists an elementary embedding $j : L(X, V_{\lambda+1}) \rightarrow L(X, V_{\lambda+1})$. Then one might expect the analysis of $L(V_{\lambda+1})$ to carry over to $L(X, V_{\lambda+1})$, and that this more general situation is really the appropriate area to study. We show, however, that inverse limit $X$-reflection cannot hold in general, and that the set of $X \subseteq V_{\lambda+1}$ such that inverse limit $X$-reflection holds is very restricted. As inverse limit reflection is a very natural property one would expect of these structures, this fact highlights $L(V_{\lambda+1})$ and its extensions satisfying inverse limit reflection as the most natural objects to study at this level.

Furthermore, while it seems as though the existence of an elementary embedding $j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$ is an analogous assumption for $L(V_{\lambda+1})$ as assuming the axiom of determinacy holds in $L(\mathbb{R})$ is for $L(\mathbb{R})$, we argue that inverse limit reflection is actually a more appropriate analog of determinacy. Indeed, we will see that the structures $L(X, V_{\lambda+1})$ which have analogous embeddings $j : L(X, V_{\lambda+1}) \rightarrow L(X, V_{\lambda+1})$ do not generally have structural properties which are analogous to the structural properties of models of determinacy, while those structures satisfying inverse limit reflection do have these properties.

Some of the above structural results which we obtain from inverse limit reflection were shown by Woodin to follow from $U(j)$-representations. In fact he showed that even stronger reflection properties follow from these representations (see Theorem 4.5.2). The similarity in the structural consequences of inverse limit reflection and $U(j)$-representations suggests that there might be some connection between the two. We explore this connection in Sections 4.2 and 4.3 and as a result are able to significantly expand the collection of $U(j)$-representable sets (see Section 4.4).

Considering these results, it seems likely that all sets in $V_{\lambda+2}^{L(V_{\lambda+1})}$ are $U(j)$-representable in $L(V_{\lambda+1})$, a conjecture which has been shown to have many interesting consequences (see Section 4.5). Proving this conjecture therefore appears to be the most natural extension of our work here.

While we concentrate here on studying $L(V_{\lambda+1})$, the above results likely extend to stronger axioms. We define the $E_0^\alpha$ hierarchy in Section 5.1.1, which was first introduced by Woodin in analogy with the definition of the minimal model of $AD_{\mathbb{R}}$ in the context of determinacy. Extending the above results on inverse limits and $U(j)$-representation to this hierarchy is a natural next step in the above analysis, and it might be the key to understanding the even stronger $V \rightarrow V$ axioms (see Section 5.1.2).
1.1 The structure $L(V_{\lambda+1})$

1.1.1 Very large cardinals

Large cardinals are the fundamental measure of consistency strength in set theory. At the lowest level, for instance, there are strongly inaccessible cardinals: a cardinal $\kappa$ is strongly inaccessible if $\kappa$ is regular and is a strong limit, so for all $\alpha < \kappa$, $2^\alpha < \kappa$. So if there exists a strongly inaccessible cardinal, Con(ZFC) holds.

For our purposes, large cardinals are of the following general form: $\kappa$ is the critical point of $j : V \rightarrow M$ where $M$ has a certain amount of agreement with $V$. $\kappa$ is measurable if it is the critical point of such an embedding $j : V \rightarrow M$ where no agreement between $M$ and $V$ is required. In general, the more agreement $M$ has with $V$, the stronger the large cardinal axiom. So for instance we have the following:

**Fact 1.1.1.** Suppose that $\kappa = \text{crit}(j)$ where $j : V \rightarrow M$ is elementary. Suppose that $V_{\kappa+2} \subseteq M$. Then $\kappa$ is a limit of measurable cardinals.

**Proof.** Let $U \subseteq P(\kappa)$ be the normal ultrafilter induced by $j$. So $A \in U$ iff $\kappa \in j(A)$. We have that $U \in V_{\kappa+2}$ and hence $\kappa$ is measurable in $M$. But by the elementarity of $j$, $\kappa$ must be a limit of measurables in $V$. \hfill $\Box$

This phenomenon that stronger large cardinals reflect weaker large cardinals is a fundamental property of these axioms, although it becomes much more difficult to show for some of the strongest axioms in the large cardinal hierarchy.

A question which immediately arises in the study of large cardinals from elementary embeddings is: how much agreement is possible between $M$ and $V$? Kunen’s Theorem gives an upper bound under ZFC.

**Theorem 1.1.2** (Kunen [Kun71]). (ZFC) There is no (non-trivial) elementary embedding $j : V \rightarrow V$.

In fact the proof gives the following upper bound for rank into rank embeddings.

**Theorem 1.1.3** (Kunen (see [Kan94])). (ZFC) Suppose that $\alpha$ is such that there exists an elementary embedding $j : V_\alpha \rightarrow V_\alpha$. Then for $\lambda = \sup_{i<\omega} \kappa_i$ where $\kappa_0 = \text{crit} j$ and for $i < \omega$, $\kappa_{i+1} = j(\kappa_i)$, we have

1. Either $\lambda = \alpha$ or $\lambda + 1 = \alpha$.
2. For all $\beta$ such that $\text{crit} j \leq \beta < \lambda$, $j(\beta) > \beta$.

Figure 1.1.1 gives a picture of rank-into-rank embeddings which we obtain from this theorem.

A fundamental question is whether it is possible to have an elementary embedding $j : V \rightarrow V$ under ZF.
The following is a list of large cardinal axioms, ordered in decreasing strength, which we will be considering in this paper ($\lambda$ is always the sup of the critical sequence of $j$, so in particular $\text{crit}(j) < \lambda$; see Section 1.2 for basic definitions).

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
</tr>
</thead>
</table>
| Reinhardt Cardinal | $\exists j: V \rightarrow V$  
|              | $\exists j : V_{\lambda+2} \rightarrow V_{\lambda+2}$                    |
| $I_0^#$     | $\exists j : L(V_{\lambda+1}^#) \rightarrow L(V_{\lambda+1}^#)$          |
| $I_0$       | $\exists j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$              |
| $I_1$       | $\exists j : V_{\lambda+1} \rightarrow V_{\lambda+1}$                    |
| $I_3$       | $\exists j : V_{\lambda} \rightarrow V_{\lambda}$                        |

There is further subdivision between $I_0$ and $I_1$, for instance, where for a fixed $\alpha$ we demand the existence of an elementary embedding $j : L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1})$. A similar type of subdivision exists between $I_0^#$ and $I_0$, and so on.

### 1.1.2 Comparison with $L(\mathbb{R})$

Besides arising in the study of very large cardinals, $L(V_{\lambda+1})$ is an example of a structure $L(V_{\alpha+1})$ for some singular strong limit $\alpha$. The case $\text{cof}(\alpha) = \omega$ is special, however, by the following theorem of Shelah.

**Theorem 1.1.4** (Shelah). *Suppose $\lambda$ is a singular strong limit of uncountable cofinality. Then $L(P(\lambda)) \models ZFC$.***
If $I_0$ holds at $\lambda$ we have $L(V_{\lambda+1}) \models \neg \text{AC}$, and so we have a similarity between $L(V_{\lambda+1})$ assuming $I_0$ at $\lambda$ and $L(\mathbb{R})$ assuming $\text{AD}^L(\mathbb{R})$. Before exploring this connection further, we fix some notation and note other obvious similarities in a lemma.

**Definition 1.1.5.** Fix $\lambda$. Call an ordinal $\alpha$ good if every member of $L_\alpha(V_{\lambda+1})$ is definable over $L_\alpha(V_{\lambda+1})$ from a member of $V_{\lambda+1}$. Define

$$\Theta = \Theta_\lambda := \sup \{ \alpha \mid (\exists \sigma (\sigma : V_{\lambda+1} \to \alpha \text{ is a surjection}))^{L(V_{\lambda+1})} \}.$$ 

**Lemma 1.1.6.** Fix $\lambda$ a strong limit such that $\text{cof}(\lambda) = \omega$. Then the following hold:

1. $L(V_{\lambda+1}) \models ZF + \lambda-\text{DC}$.
2. The good ordinals are cofinal in $\Theta_\lambda$.
3. $\Theta_\lambda$ is regular in $L(V_{\lambda+1})$.
4. $L_{\Theta_\lambda}(V_{\lambda+1}) \models ZF^-$.
5. Suppose that $j : L_\alpha(V_{\lambda+1}) \to L_\beta(V_{\lambda+1})$ is elementary for $\alpha$ good. Then $j$ is induced by $j \upharpoonright V_{\lambda}$.

**Proof.** 1, 3, and 4 are as in the $L(\mathbb{R})$ case. For 2 and 5, see [Lav01].

The following is a selection of results which show a significant similarity between the two structures $L(\mathbb{R})$ and $L(V_{\lambda+1})$.

**Theorem 1.1.7** (Woodin [Woo11]). Fix $\lambda$ such that there exists an elementary embedding $j : L(V_{\lambda+1}) \to L(V_{\lambda+1})$. Then the following hold in $L(V_{\lambda+1})$:

1. For cofinally many $\kappa < \Theta_\lambda$, $\kappa$ is measurable, and this is witnessed by the club filter restricted to a stationary subset of $\kappa$.
2. If $\alpha < \Theta_\lambda$ then $P(\alpha) \in L_{\Theta_\lambda}(V_{\lambda+1})$.

There are important differences between $L(\mathbb{R})$ and $L(V_{\lambda+1})$ however. As an example we consider the case of the club filter on $\lambda^+$. Solovay showed that if $\text{AD}^L(\mathbb{R})$ holds then the club filter is an ultrafilter on $\omega_1$ in $L(\mathbb{R})$. One might expect such a result to hold in $L(V_{\lambda+1})$, but there are two reasons it cannot. First of all, if $S_\alpha = \{ \kappa < \lambda^+ \mid \text{cof}(\kappa) = \alpha \}$ then the set of $S_\alpha$ for $\alpha < \lambda$ regular is a collection of disjoint stationary subsets of $\lambda^+$. This problem however appears to be fairly trivial as we could simply modify our question by asking instead if the club filter restricted to each $S_\alpha$ is a ultrafilter for each regular $\alpha < \lambda$. This leads to a second more serious problem, which is displayed by the following theorem.
Theorem 1.1.8 (Woodin). Fix $\lambda$ and let $\kappa < \lambda$ be an uncountable regular cardinal. Let $S_\kappa = \{\alpha < \lambda^+ | \text{cof}(\alpha) = \kappa\}$ and let $F$ be the club filter on $\lambda^+$. If $G \subseteq \text{Coll}(\kappa, \kappa^+)$ is $V$-generic then

$$L(V[G]_{\lambda+1}) \models F \text{ restricted to } S_\kappa \text{ is not an ultrafilter.}$$

In fact for any $\beta < \lambda$, there exists a poset $P$ such that if $G \subseteq P$ is $V$-generic then in $L(V[G]_{\lambda+1})$ there is a partition $\langle T_\alpha | \alpha < \gamma \rangle$ of $S_\kappa$ into stationary sets for some $\gamma \geq \beta$, such that for all $\alpha < \gamma$, $F$ restricted to $T_\alpha$ is an ultrafilter.

This second problem is part of a larger issue which we call the ‘right $V$ problem’: the theory of $V_\lambda$ can be changed by small forcing, while the theory of $V_\omega$ cannot. Hence a property of $L(V_{\lambda+1})$ might depend on the theory of $V_\lambda$, and thus not be provable from the existence of the elementary embedding alone.

There are several ways one might try to get around the right $V$ problem. One might restrict the question to those cases which are not generically fragile. In the case of the club filter on $\lambda^+$, whether the club filter restricted to $S_\omega$ is an ultrafilter in $L(V_{\lambda+1})$ is left open by the above theorem. We will give evidence below towards proving that this is indeed the case (see Theorems 3.1.8 and 3.1.11).

Secondly, one could ask the question instead in the $L(V_{\lambda+1})$ of some canonical $L$-like inner model. Such an analysis would surely be possible and enlightening if such an inner model exists. We do not attempt such an analysis here.

Thirdly, one could modify the question in order to circumvent the right $V$ problem. Such a modification would presumably restrict attention to generically stable objects. An example of such a modification is the generic absoluteness given by $U(j)$-representations (see Theorem 4.5.2).

The following table lists some differences and similarities between $L(\mathbb{R})$ and $L(V_{\lambda+1})$.

1.2 Set theory definitions and conventions

We denote by $V_\alpha$ for $\alpha$ an ordinal the stratification of $V$ according to rank. So $V_0 = \emptyset$, $V_{\alpha+1} = P(V_\alpha)$ and $V_\lambda = \bigcup_{\alpha<\lambda} V_\alpha$ for $\lambda$ a limit. For a transitive set $A$, $L(A)$ is the constructible hierarchy built on top of $A$. So $L_0(A) = A$, $L_{\alpha+1}(A) = \text{Def}(L_\alpha(A))$ and $L_\lambda(A) = \bigcup_{\alpha<\lambda} L_\alpha(A)$ for $\lambda$ a limit. By $L(X, A)$ we mean the constructible hierarchy built on top of $A$, with $X$ as a predicate. So $L_0(X, A) = A$, $L_{\alpha+1}(X, A) = \text{Def}(L_\alpha(A), X \cap L_\alpha(A))$ and $L_\lambda(X, A) = \bigcup_{\alpha<\lambda} L_\alpha(X, A)$ for $\lambda$ a limit.

Suppose that $M$ and $N$ are models of a fragment of set theory. Then $j : M \rightarrow N$ is an elementary embedding if for all $\phi[x_1, \ldots, x_n]$ and $a_1, \ldots, a_n \in M$ we have that

$$M \models \phi(a_1, \ldots, a_n) \Rightarrow N \models \phi(j(a_1), \ldots, j(a_n)).$$

We use the convention that all elementary embeddings are nontrivial, so $j \neq \text{id}$. So $\text{crit}(j)$ is the least ordinal $\alpha$ such that $j(\alpha) > \alpha$.

Suppose that $\langle a_i \mid i < \omega \rangle$ is a sequence of sets. Then by $a = \lim_{i \rightarrow \omega} a_i$ we mean that

$$a = \{b \mid \exists n \forall i \geq n (b \in a_i)\}.$$ 

So for instance, if each $a_i$ is an ordinal and the sequence converges to an ordinal $\beta$, then $\lim_{i \rightarrow \omega} a_i = \beta$.

When we say that $j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$ is an elementary embedding we will always be assuming that $\text{crit}(j) < \lambda$ unless we specifically say otherwise. The same thing holds for embeddings $V_{\lambda+1} \rightarrow V_{\lambda+1}$, $L_\alpha(V_{\lambda+1}) \rightarrow L_\alpha(V_{\lambda+1})$ and so on.

When referring to a vector $\vec{j}$, we will almost always be assuming that it is of the form

$$\vec{j} = \langle j_i \mid i < \omega \rangle.$$ 

We will many times use this shorthand without explicitly specifying the indices.

Many times we will say, let $a_n = (j_0 \circ \cdots \circ j_{n-1})(a)$ for $n < \omega$. By this we mean that $a_0 = a$, $a_1 = j_0(a)$, $\ldots$.

When referring to elementary embeddings $j, k : V_{\lambda+1} \rightarrow V_{\lambda+1}$ we will many times apply $j(k)$, although this strictly does not make sense. By this we mean that we apply $j(k \upharpoonright V_\lambda)$ and then look at the natural extension to an embedding on $V_{\lambda+1}$.

Also note that when referring to an elementary embedding $j$, it is many times standard in the literature to refer to the iterates of $j$ as $j_n$. We will globally defy this convention, as we are most concerned with sequences of embeddings which we label as $j_n$. When we wish to refer to the iterate of $j$, we will use the notation $j^{(n)}$. 

Chapter 2

Inverse Limits

2.1 Basic properties

In this section we introduce the theory of inverse limits. These structures are most readily used for reflecting large cardinal hypotheses of the form: there exists an elementary embedding \( \text{L}_\alpha(V_{\lambda+1}) \rightarrow \text{L}_\alpha(V_{\lambda+1}) \). The use of inverse limits in reflecting such large cardinals is originally due to Laver (see Laver [Lav97], [Lav01]).

Suppose there exists an elementary embedding \( j : V_{\lambda} \rightarrow V_{\lambda} \). Then if \( j \) extends to an elementary embedding \( j^* : V_{\lambda+1} \rightarrow V_{\lambda+1} \) we have \( j^*(A) = \bigcup_{i} j(A \cap V_{\lambda_i}) \) for \( \langle \lambda_i | i < \omega \rangle \) any cofinal sequence in \( \lambda \), as \( \lambda \) is a continuity point. Hence any elementary embedding \( V_{\lambda+1} \rightarrow V_{\lambda+1} \) can be coded as an element of \( V_{\lambda+1} \).

Suppose that \( \langle j_i | i < \omega \rangle \) is a sequence of elementary embeddings such that the following hold:

1. For all \( i \), \( j_i : V_{\lambda+1} \rightarrow V_{\lambda+1} \) is elementary.

2. There exists \( \bar{\lambda} < \lambda \) such that \( \text{crit} j_0 < \text{crit} j_1 < \cdots < \bar{\lambda} \) and \( \lim_{i < \omega} \text{crit} j_i = \bar{\lambda} \).

Then we can form the inverse limit

\[
J = j_0 \circ j_1 \circ \cdots : V_{\bar{\lambda}} \rightarrow V_{\lambda}
\]

by setting

\[
J(a) = \lim_{i \rightarrow \omega} (j_0 \circ \cdots \circ j_i)(a)
\]

for any \( a \in V_{\bar{\lambda}} \).

Claim 2.1.1 (Laver). \( J : V_{\bar{\lambda}} \rightarrow V_{\lambda} \) is elementary.

Proof. It is enough to see that \( \sup_{\alpha < \bar{\lambda}} J(\alpha) = \lambda \). To see this let \( J_i = j_i \circ j_{i+1} \circ \cdots \). Set \( \alpha_i = \sup_{\alpha < \bar{\lambda}} J_i(\alpha) \). Then we have

\[
\alpha_0 \geq \alpha_1 \geq \cdots
\]
as \( j_i(\alpha_{i+1}) = \alpha_i \) for all \( i < \omega \). Let \( n \) be large enough so that for all \( i \geq n \), \( \alpha_n = \alpha_i \). Then we have that \( j_n(\alpha_n) = \alpha_n \). But since \( \lambda \geq \alpha_n > \text{crit} \, j_n \), we must have that \( \alpha_n = \lambda \). But then \( \alpha_0 = \lambda \) since \( \alpha_0 = (j_0 \circ \cdots \circ j_{n-1})(\alpha_n) \).

So since \( J : V_\lambda \to V_\lambda \) is elementary, it can be extended to a \( \Sigma_0 \)-embedding

\[
J^* : V_{\lambda+1} \to V_{\lambda+1}
\]

by \( J(A) = \bigcup_i J(A \cap V_{\lambda_i}) \) for \( \langle \lambda_i \mid i < \omega \rangle \) any cofinal sequence in \( \lambda \). Furthermore by a theorem of Laver [Lav97], if for all \( i, j_i \) extends to an elementary embedding \( V_{\lambda+1} \to V_{\lambda+1} \), then \( J^* \) is elementary. We defer the proof of this theorem to Section 2.2. In fact we will always assume that \( J^* : V_{\lambda+1} \to V_{\lambda+1} \) is elementary and define the inverse limit of \( \langle j_i \mid i < \omega \rangle \) to be \( J = J^* : V_{\lambda+1} \to V_{\lambda+1} \). But we will sometimes treat \( J \) as if it were an element of \( V_{\lambda+1} \).

We write \( \lambda_j \) for the unique \( \lambda \) such that \( J : V_{\lambda+1} \to V_{\lambda+1} \). We will often drop reference to the sequence \( \langle j_i \mid i < \omega \rangle \) in our notation when talking about the inverse limit \( J \), though the sequence is not unique for a given inverse limit \( J \) (for instance, by simply grouping the embeddings as, say, \( J = (j_0 \circ j_1) \circ j_2 \circ \cdots \)); it will always be clear from context which embeddings we mean when referring to \( \langle j_i \mid i < \omega \rangle \).

Suppose \( J = j_0 \circ j_1 \circ \cdots \) is an inverse limit. Then for \( i < \omega \) we write \( J_i := j_i \circ j_{i+1} \circ \cdots \), the inverse limit obtained by ‘chopping off’ the first \( i \) embeddings. For \( i < \omega \) we write

\[ J^{(i)} := (j_0 \circ \cdots \circ j_i)(J) \]

and for \( n < \omega \),

\[ j_n^{(i)} := (j_0 \circ \cdots \circ j_i)(j_n). \]

Then we can rewrite \( J \) in the following useful ways:

\[
J = j_0 \circ j_1 \circ \cdots = \cdots (j_0 \circ j_1)(j_2) \circ j_0(j_1) \circ j_0 = \cdots j_2^{(1)} \circ j_1^{(0)} \circ j_0
\]

and

\[
J = j_0 \circ J_1 = j_0(J_1) \circ j_0 = J_1^{(0)} \circ j_0
\]

\[
= (j_0 \circ \cdots \circ j_{i-1})(J_i) \circ j_0 \circ \cdots \circ j_{i-1} = J_i^{(i-1)} \circ j_0 \circ \cdots \circ j_{i-1}
\]

for any \( i > 0 \). Hence we can view an inverse limit \( J \) as a direct limit (see Figure 2.1), though both perspectives are useful in different situations. We let \( \mathcal{E} \) be the set of inverse limits. So

\[
\mathcal{E} = \{(J, \langle j_i \mid i < \omega \rangle) \mid J = j_0 \circ j_1 \circ \cdots : V_{\lambda_j+1} \to V_{\lambda+1}\}.
\]

**Lemma 2.1.2.** If \( (K, \vec{k}) \in \mathcal{E} \) and \( A \in V_{\lambda+1} \) are such that \( A \in \text{rng} \, K \), then for all \( i \), \( A \in \text{rng} \, (k_0 \circ \cdots \circ k_i) \).
Figure 2.1: Direct limit decomposition of an inverse limit.
Lemma 2.1.3 (Martin). Suppose \( \alpha \) is good. If \( j : L_{\alpha+1}(V_{\lambda+1}) \rightarrow L_{\alpha+1}(V_{\lambda+1}) \) is elementary then for all \( A, B \in V_{\lambda+1} \) and \( \beta < \text{crit}(j) \) there exists a \( k : L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}) \) such that

\[
j(\beta) < \text{crit } k < \text{crit } j, \quad j(A) = k(A), \quad B \in \text{rng } k \quad \text{and} \quad \beta < \text{crit } k < \text{crit } j.
\]

Proof. Given \( \alpha, j, A, B, \) and \( \beta \) as in the hypothesis, we want to show that \( L_{\alpha+1}(V_{\lambda+1}) \models \exists k : V_{\lambda} \rightarrow V_{\lambda} \) which induces \( \hat{k} : L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}) \) such that

\[
\beta < \text{crit } k < \text{crit } j, \quad j(A) = k(A) \quad \text{and} \quad B \in \text{rng } (k).
\]

Note that since \( \alpha \) is good, an elementary embedding \( k : L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}) \) is induced by \( k \upharpoonright V_{\lambda} \). Applying \( j \), this is equivalent to \( L_{\alpha+1}(V_{\lambda+1}) \models \exists k : V_{\lambda} \rightarrow V_{\lambda} \) which induces \( \hat{k} : L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}) \) such that \( j(\beta) < \text{crit } k < \text{crit } j(j), \quad j(j)(j(A)) = \hat{k}(j(A)) \) and \( j(B) \in \text{rng } (\hat{k}) \). But \( j \upharpoonright V_{\lambda} \) satisfies this second statement. So we are done by elementarity of \( j \).

Note that we can replace \( A \) and \( B \) with any sequence of length less than \( \text{crit } j \) by coding. We will do so below without any comment.

Define

\[
E_\alpha = \{(J, \bar{f}) \in E | \forall i < \omega \quad (j_i \text{ extends to an elementary embedding } L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}))\}.
\]

Lemma 2.1.4 (Laver). Suppose there exists an elementary embedding

\[
j : L_{\alpha+1}(V_{\lambda+1}) \rightarrow L_{\alpha+1}(V_{\lambda+1})
\]

where \( \alpha \) is good. Then \( E_\alpha \neq \emptyset \).

Proof. Inductively define \( j_i \) as follows, repeatedly using Lemma 2.1.3. Let \( j_0 \) be such that \( \text{crit } j_0 < \text{crit } j \) and \( j_0 : L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}) \) is elementary. Having chosen

\[
j_0, \ldots, j_i : L_{\alpha}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1})
\]

such that

\[
\text{crit } j_0 < \text{crit } j_1 < \cdots < \text{crit } j_i < \text{crit } j,
\]
let \( j_{i+1} \) be such that
\[
\text{crit } j_i < \text{crit } j_{i+1} < \text{crit } j
\]
and \( j_{i+1} \) extends to \( j_{i+1} : L_\alpha(V_{\lambda+1}) \rightarrow L_\alpha(V_{\lambda+1}) \).
Then clearly we have that
\[
\text{crit } j_0 < \text{crit } j_1 < \cdots < \text{crit } j
\]
and hence \( \lim_{i \to \omega} \text{crit } j_i = \bar{\lambda} < \lambda \) for some \( \bar{\lambda} \). Let \( J = j_0 \circ j_1 \circ \cdots \).

Remark 2.1.5. While the motivation for using inverse limits for reflection is fairly clear, we will find below that inverse limits have a wide array of uses which go far beyond their initial use as reflection embeddings. In fact, for some applications (for instance Theorem 4.2.3) we do not even use inverse limits as embeddings, but rather as a sort of operator. This might seem somewhat bizarre at first, but it is perhaps somewhat clarified by the following alternative definition of a restricted class of inverse limits:

Suppose \( j : V_{\lambda+1} \rightarrow V_{\lambda+1} \) is elementary and \( \langle k_i | i < \omega \rangle \) is a sequence such that the following hold for all \( i < \omega \).

1. \( k_i : V_{\lambda+1} \rightarrow V_{\lambda+1} \) is elementary.
2. \( k_i \) is a square root of \( j \).
3. \( k_i \upharpoonright V_\lambda \in \text{rng } k_{i+1} \).

Then we have
\[
\text{crit } k_0 < \text{crit } k_1 < \cdots < \text{crit } j < \lambda,
\]
and hence for \( K = k_0 \circ k_1 \circ \cdots \), \( (K, \langle k_i | i < \omega \rangle) \) is an inverse limit.

To see this, note for instance that since \( k_0 \upharpoonright V_\lambda \in \text{rng } k_1 \), that \( \text{crit } k_0 \in \text{rng } k_1 \). But if \( \text{crit } k_1 \leq \text{crit } k_0 \) then, since
\[
k_1(\text{crit } (k_1)) = \text{crit } j > \text{crit } k_0,
\]
we must have \( \text{crit } k_0 \notin \text{rng } k_1 \), a contradiction. Hence \( \text{crit } k_0 < \text{crit } k_1 < \text{crit } j \). And we have \( \text{crit } k_0 < \text{crit } k_1 < \cdots < \text{crit } j < \lambda \) similarly by induction.

So an inverse limit is a natural outcome of repeated applications of the square root lemma. In fact this restricted class of inverse limits has many useful properties which we will make use of in Section 4. In light of this fact, we make the following definition:

Definition 2.1.6. Suppose \( (K, \bar{k}) \in \mathcal{E} \) and \( j : V_{\lambda+1} \rightarrow V_{\lambda+1} \) are such that the following hold:

1. For all \( i \), \( k_i(\upharpoonright V_\lambda) = j \upharpoonright V_\lambda \).
2. For all \( i \), \( k_0 \upharpoonright V_\lambda, \ldots, k_i \upharpoonright V_\lambda \in \text{rng } k_{i+1} \).

Then we say that \( (K, \bar{k}) \) is an inverse limit root of \( j \).
There is a corresponding square root lemma for inverse limits. Suppose
\[(J, \langle j_i \rangle), (K, \langle k_i \rangle) \in E.\]
Then we say that \(K\) is a limit root of \(J\) if there is \(n < \omega\) such that \(\bar{\lambda}_J = \bar{\lambda}_K\) and
\[
\forall i < n (k_i = j_i) \text{ and } \forall i \geq n (k_i(k_i) = j_i).
\]
We say \(K\) is an \((n\text{-close})\) limit root of \(J\) if \(n\) witnesses that \(K\) is a limit root of \(J\).

**Lemma 2.1.7** (Laver [Lav97]). Suppose \(\alpha\) is good. If \((J, \bar{j}) \in E_{\alpha+1}\) then for all \(\bar{A} \in V_{\bar{\lambda}+1}\) and \(B \in V_{\lambda+1}\) there exists a \((K, \bar{k}) \in E_{\alpha}\) such that \(K\) is a limit root of \(J\), \(K(\bar{A}) = J(\bar{A})\) and \(B \in \text{rng } K\).

While Laver’s original statement did not include the notion of being a limit root, the proof is identical.

**Proof.** We use Lemma 2.1.3 \(\omega\)-many times to \(j_0, j_1, \ldots\) in succession. Define \(k_0, k_1, \ldots\) by induction as follows. Let \(k_0 : L_\alpha(V_{\lambda+1}) \rightarrow L_\alpha(V_{\lambda+1})\) be given by Lemma 2.1.3 such that \(B \in \text{rng } k_0\) and for all \(i\)
\[
j_0((j_1 \circ \cdots \circ j_i)(\bar{A})) = k_0((j_1 \circ \cdots \circ j_i)(\bar{A})).
\]
After defining \(k_0, \ldots, k_n\) let \(k_{n+1} : L_\alpha(V_{\lambda+1}) \rightarrow L_\alpha(V_{\lambda+1})\) be given by Lemma 2.1.3 such that
\[
(k_0 \circ \cdots \circ k_n)^{-1}(B) \in \text{rng } k_{n+1},
\]
crit \(j_n < \text{crit } k_{n+1} < \text{crit } j_{n+1}\) and for all \(i\)
\[
j_n((j_{n+1+1} \circ \cdots \circ j_{n+i})(\bar{A})) = k_n((j_{n+1+1} \circ \cdots \circ j_{n+i})(\bar{A})).
\]
A calculation shows that \(\text{crit } k_0 < \text{crit } k_1 < \cdots < \bar{\lambda}\), lim\(_{i \rightarrow \omega}\) \text{crit } (k_i) = \bar{\lambda}\), and for
\[
K := k_0 \circ k_1 \circ \cdots
\]
we have \(K(\bar{A}) = J(\bar{A})\) and \(B \in \text{rng } K\);

To see that \(K(\bar{A}) = J(\bar{A})\), note that it is enough to see that for all \(\beta < \bar{\lambda}\), if \(\bar{A}' = \bar{A} \cap V_\beta\), then \(K(\bar{A}') = J(\bar{A}')\). Let \(n\) be large enough so that \(\text{crit } (k_n) > \beta\). Then we have that
\[
J(\bar{A}') = (j_0 \circ \cdots \circ j_{n-1})(\bar{A}')
= (j_0 \circ \cdots \circ j_{n-2})(k_{n-1}(\bar{A}'))
= (j_0 \circ \cdots \circ j_{n-3})(k_{n-2} \circ k_{n-1})(\bar{A}')
= \cdots
= (k_0 \circ \cdots \circ k_{n-1})(\bar{A}') = K(\bar{A}')
\]
To see that $B \in \text{rng } K$, let $\tilde{\kappa}_i = \text{crit } k_i$ and set $\kappa_i = K(\tilde{\kappa}_i)$. It is enough to see that for all $i < \omega$, if $B' = B \cap V_{\kappa_i}$, then $B' \in \text{rng } K$. Let $i < \omega$. Then we have that $(k_0 \circ \cdots \circ k_i)^{-1}(B')$ is defined since

$$K(\tilde{\kappa}_i) = (k_0 \circ \cdots \circ k_i)(\tilde{\kappa}_i).$$

But then we have that

$$K((k_0 \circ \cdots \circ k_i)^{-1}(B')) = B',$$

which is what we wanted. $\square$

A key difference between embeddings for square roots and being a limit root for inverse limits is that if $k(k) = j$ then $\text{crit } k < \text{crit } j$ whereas if $K$ is a limit root of $J$ then $\text{crit } K \leq \text{crit } J$. So while there is no sequence $k_0, k_1, \ldots$ such that for all $i < \omega$, $k_{i+1}(k_{i+1}) = k_i$, we have the following lemma for limit roots.

**Lemma 2.1.8.** Suppose that $\alpha$ is good and $(J, \bar{j}) \in E_{\alpha+\omega}$. Then there exists a sequence $\langle (K^i, \tilde{k}^i) \mid i < \omega \rangle$ such that the following hold:

1. $K^0 = J$.
2. For all $i$, $(K^i, \tilde{k}^i) \in E_{\alpha}$.
3. For all $i$, $K^{i+1}$ is a limit root of $K^i$.

**Proof.** Let $(J, \bar{j}) \in E_{\alpha+\omega}$. Set $K^0 = J$, and choose $(K^{m+1}, \tilde{k}^{m+1})$ by induction as follows. Suppose that $(K^0, \tilde{k}^0), \ldots, (K^m, \tilde{k}^m)$ have been chosen so that $(K^m, \tilde{k}^m) \in E_{\alpha}$ and there exists $\langle n^m_i \mid i < \omega \rangle$ such that for all $i < \omega$, $n^m_i < \omega$, $k^m_i$ extends to

$$\hat{k}^m_i : L_{\alpha+n^m_i}(V^{\lambda+1}) \rightarrow L_{\alpha+n^m_i}(V^{\lambda+1}),$$

and $\lim_{i \rightarrow \omega} n^m_i = \infty$. Let $i$ be large enough so that for all $i' \geq i$, $n^m_{i'} > 0$. Then by the proof of Lemma 2.1.7, there is $K^{m+1}$ which is an $i$-close limit root of $K^m$ such that for all $i' \geq i$, $\hat{k}^{m+1}_{i'}$ extends to

$$\hat{k}^{m+1}_{i'} : L_{\alpha+n^{m+1}_{i'}}(V^{\lambda+1}) \rightarrow L_{\alpha+n^{m+1}_{i'}}(V^{\lambda+1}).$$

We have that

$$\lim_{i \rightarrow \omega} (n_i^m - 1) = \infty,$$

and hence we can continue the induction. The sequence we produce $\langle (K^i, \tilde{k}^i) \mid i < \omega \rangle$ clearly satisfies the lemma. $\square$

Of course, if we considered the more restrictive notion of being a 0-close limit root, then such sequences as in Lemma 2.1.8 would indeed be impossible. We will see though that the added benefit afforded by Lemma 2.1.8 will be very useful. As a first example, we obtain sets of inverse limits which are in a sense closed under the square root lemma.
Definition 2.1.9. Suppose $E \subseteq \mathcal{E}$. Then we say that $E$ is saturated if for all $(J, \vec{j}) \in E$ there exists an $i < \omega$ such that for all $A \in V_{\lambda_j+1}$, and $B \in V_{\lambda+1}$, there exists $(K, \vec{k}) \in E$ such that $K$ is an $i$-close limit root of $J$, $K_i(A) = J_i(A)$ and $B \in \text{rng} K_i$. We set $i(E, J) =$ the least such $i$.

Note that if $K$ is an $i$-close limit root of $J$ and $K_i(A) = J_i(A)$ then $K(A) = J(A)$. However, we cannot conclude that $B \in \text{rng} K$ if $B \in \text{rng} K_i$. For instance if $i = 1$ then we always have that $\text{crit}(J) = \text{crit}(K) \notin \text{rng} K$.

We will use the same terminology of being saturated for $E$ such that there is $\alpha$ good such that for all $(J, \vec{j}) \in E$ and $i < \omega$, $j_i : L_\alpha(V_{\lambda+1}) \rightarrow L_\alpha(V_{\lambda+1})$ is elementary.

As a corollary to the proof of Lemma 2.1.8 we have:

Corollary 2.1.10. Suppose that $\alpha$ is good and $(J, \vec{j}) \in \mathcal{E}_{\alpha+\omega}$. Then there exists a saturated set $E \subseteq \mathcal{E}_\alpha$ such that $(J, \vec{j}) \in E$.

Proof. Let $E$ be the set of all $(K, \vec{k}) \in \mathcal{E}_\alpha$ such that there exists a sequence $\langle n_i | i < \omega \rangle$ such that $\lim_{i<\omega} n_i = \infty$ and for all $i < \omega$, $n_i < \omega$ and $k_i$ extends to

$$\hat{k}_i : L_{\alpha+n_i}(V_{\lambda+1}) \rightarrow L_{\alpha+n_i}(V_{\lambda+1}).$$

Since $(J, \vec{j}) \in \mathcal{E}_{\alpha+\omega}$ we must have that $(J, \vec{j}) \in E$. So the lemma follows by the proofs of Lemmas 2.1.7 and 2.1.8. \qed

Lemma 2.1.11. Suppose $E \subseteq \mathcal{E}$ is saturated. Let $(J, \vec{j}) \in E$, $\vec{A} \in V_{\lambda_j+1}$, and suppose

$$J(\vec{A}) = A \in V_{\lambda+1}.$$

Set

$$E(\vec{A}, A) = \{(K, \vec{k}) \in E | K(\vec{A}) = A\}.$$

Then $E(\vec{A}, A)$ is saturated.

Proof. Suppose $(K, \vec{k}) \in E(\vec{A}, A)$. Then $(K, \vec{k}) \in E$, so there is $i < \omega$ such that for all $C \in V_{\lambda_j+1}$ and $B \in V_{\lambda+1}$ there exists $(K', \vec{k'}) \in E$, an $i$-close limit root of $K$ such that $K_i(C) = K'_i(C)$ and $B \in \text{rng} K'_i$. But then $i$ is such that for all $C \in V_{\lambda_j+1}$ and $B \in V_{\lambda+1}$ there exists $K' \in E$, an $i$-close limit root of $K$ such that $K_i(C) = K'_i(C)$, $K'_i(\vec{A}) = K_i(\vec{A}) = A$ and $B \in \text{rng} K'_i$. So $K'(\vec{A}) = K(\vec{A}) = A$ and hence $(K', \vec{k'}) \in E(\vec{A}, A)$. Hence $E(\vec{A}, A)$ is saturated. \qed

Finally note that if $k(k) = j$ and $A \in \text{rng} k$, then $k(A) = j(A)$. To see this suppose $k(B) = A$, and notice

$$k(A) = k(k(B)) = k(k(k(B))) = j(k(B)) = j(A).$$

We can show a similar property for inverse limits:
Lemma 2.1.12. Suppose that $(K, \bar{k}), (J, \bar{j}) \in \mathcal{E}$ and $K$ is a limit root of $J$. Let $\bar{\lambda} = \bar{\lambda}_J$. Suppose $\bar{A} \in V_{\bar{\lambda}}$ and $A = J(\bar{A})$. Then if $A \in \text{rng} K$, we have

$$K(\bar{A}) = A = J(\bar{A}).$$

Proof. Let $A_n$ for $n < \omega$ be defined by induction as

$$A_0 = (j_0)^{-1}(A) \text{ and for } n \geq 0, A_{n+1} = (j_{n+1})^{-1}(A_n).$$

Then we have (case 1)

$$k_0 \text{ is a squareroot of } j_0 \text{ and } A \in \text{rng} k_0 \cap \text{rng} j_0 \Rightarrow A_0 = j_0^{-1}(A) \in \text{rng} k_0 \Rightarrow k_0(A_0) = j_0(A_0) \Rightarrow A_0 \in \text{rng} K_1$$

and (case 2)

$$k_0 = j_0 \Rightarrow k_0(A_0) = j_0(A_0) \Rightarrow A_0 \in \text{rng} K_1.$$

Similarly, for $n \geq 0$, (case 1)

$$k_{n+1} \text{ is a squareroot of } j_{n+1} \text{ and } A_n \in \text{rng} k_{n+1} \cap \text{rng} j_{n+1} \Rightarrow A_{n+1} = j_{n+1}^{-1}(A_n) \in \text{rng} k_{n+1} \Rightarrow k_{n+1}(A_{n+1}) = j_{n+1}(A_{n+1}) \Rightarrow A_{n+1} \in \text{rng} K_{n+2}$$

and (case 2)

$$k_{n+1} = j_{n+1} \Rightarrow k_{n+1}(A_{n+1}) = j_{n+1}(A_{n+1}) \Rightarrow A_{n+1} \in \text{rng} K_{n+2}.$$

Hence we have that

$$K(\bar{A}) = A = J(\bar{A})$$

as in the proof of Lemma 2.1.7.

We note the following two lemmas for completeness, although we will not use them. Lemma 2.1.14 provides a slight generalization of Lemma 2.1.3, and it is in fact implied by that lemma in the case that $J \in \text{rng} K$. Lemmas 2.1.12-2.1.14 provide a somewhat complete picture of the agreement between an inverse limit and its limit root. Note that Lemma 2.1.13 displays a strict limitation on the agreement of Lemma 2.1.14. And hence the agreement of Lemma 2.1.12 is in some sense much stronger.

Lemma 2.1.13. Suppose $(J, \bar{j}) \in \mathcal{E}$ and $A \in V_{\bar{\lambda}}$. Then there exists an $i$ such that $A \in \text{rng} J_i^{(i-1)}$.

Proof. Let $\alpha < \lambda$ be such that $A \in V_{\alpha}$. Then since $\langle \text{crit } J_i^{(i-1)} | i < \omega \rangle$ is cofinal in $\lambda$, there is an $i$ such that $\alpha < \text{crit } J_i^{(i-1)}$. Clearly then we have that $A \in \text{rng } J_i^{(i-1)}$. 

\[\square\]
Lemma 2.1.14. Suppose that \((K, \vec{k}), (J, \vec{j}) \in \mathcal{E}\), \(K\) is a limit root of \(J\) and for all \(i\),

\[ k_0 \upharpoonright V_{\lambda}, \ldots, k_i \upharpoonright V_{\lambda} \in \text{ rng } k_{i+1}. \]

Let \(\bar{\lambda} = \bar{\lambda}_0 = \bar{\lambda}_J\) and \(\lambda_i = (j_0 \circ \cdots \circ j_{i-1})(\bar{\lambda}).\)

Suppose \(\bar{A} \in V_{\lambda_{0+1}}\) and \(A = J(\bar{A})\). Then if \(i\) is such that \(\bar{A} \in \text{ rng } K_i^{(i-1)}\), then

\[ K_i^{(i-1)}((j_0 \circ \cdots \circ j_{i-1})(\bar{A})) = A = J(\bar{A}). \]

Proof. Without loss of generality we assume \(i = 1\). Then we have that \(\bar{A} \in \text{ rng } k_1^{(0)}\). But since \(k_0 \in \text{ rng } k_1\), we have \(j_0 \in \text{ rng } k_1^{(0)}\). Hence \(j_0(\bar{A}) \in \text{ rng } k_1^{(0)}\). And so since \(k_1^{(0)}\) is a square root of \(j_1^{(0)}\), we have that

\[ k_1^{(0)}(j_0(\bar{A})) = j_1^{(0)}(j_0(\bar{A})) = (j_0 \circ j_1)(\bar{A}). \]

And since

\[ (k_1^{(0)})^{-1}(\bar{A}), k_1^{(0)} \in \text{ rng } k_2^{(0)}\]

we have \(\bar{A} \in \text{ rng } k_2^{(0)}\). Furthermore \(k_0 \in \text{ rng } k_2\) implies that \(j_0 \in \text{ rng } k_2^{(0)}\), so we have that \(j_0(\bar{A}) \in \text{ rng } k_2^{(0)}\). And hence that

\[ k_1^{(0)}(j_0(\bar{A})) \in \text{ rng } k_1^{(0)}(k_2^{(0)}) = k_2^{(1)}. \]

But this shows that

\[ k_2^{(1)}(k_1^{(0)}(j_0(\bar{A}))) = j_2^{(1)}(k_1^{(0)}(j_0(\bar{A}))) = j_2^{(1)}(j_1^{(0)}(j_0(\bar{A}))) = (j_0 \circ j_1 \circ j_2)(\bar{A}) \]

since \(k_2^{(1)}\) is a square root of \(j_2^{(1)}\).

Continuing this way we have that

\[ (j_0 \circ \cdots \circ j_{i-1})(\bar{A}) = (k_1^{(0)} \circ \cdots \circ k_{i-1}^{(0)})(j_0(\bar{A})) \]

for all \(i > 0\), which proves the lemma.

\[ \square \]

2.1.1 Sequences of inverse limits

We will show in this section that sequences of inverse limit roots have a powerful continuity property. We will use this property many times below. As usual, we often write \(\langle K^i | i < \omega \rangle\) instead of \(\langle (K^i, \vec{k}^i) | i < \omega \rangle\) for a sequence of inverse limits, with the underlying embeddings being understood.
Lemma 2.1.15. Suppose $\langle K^i \mid i < \omega \rangle$ is such that for all $i$, $K^{i+1}$ is a limit root of $K^i$. Then there exists an increasing sequence $\langle i_n \mid n < \omega \rangle$ such that for all $n < \omega$ and $s \geq i_n$, we have that $k^s_n = k^{i_n}$.

Proof. Suppose the lemma does not hold and $n$ is least such that there is no $i_n$ such that for all $s > i_n$, $k^s_n = k^{i_n}$. Then there is a sequence $\langle s_i \mid i < \omega \rangle$ such that $\langle k^{s_i}_n \mid i < \omega \rangle$ is such that for all $i > 0$ there exists an $m$ such that

$$(k^{s_i}_n)(m) = k^{s_{i-1}}_n$$

where we write $j_{(m)}$ for the $m$-th iterate of an embedding $j$. But there can be no such sequence since for all $i > 0$, $\text{crit}(k^{s_i}_n) < \text{crit}(k^{s_{i-1}}_n)$. So the lemma follows.

For $\langle K^i \mid i < \omega \rangle$ such that there exists $\langle i_n \mid n < \omega \rangle$, an increasing sequence satisfying that for all $n < \omega$ and $s \geq i_n$, $k^s_n = k^{i_n}$, we call

$$K = k^{i_0}_0 \circ k^{i_1}_1 \circ \cdots$$

the common part of $\langle K^i \mid i < \omega \rangle$, and

$$\langle i_n \mid n < \omega \rangle$$

a common part index sequence for $\langle K^i \mid i < \omega \rangle$.

The following is a key continuity property of inverse limit sequences.

Lemma 2.1.16. Suppose that for $i < \omega$, $(J^i, \lambda^i) \in \mathcal{E}$. And suppose the common part of $\langle J^i \mid i < \omega \rangle$ is $K$ and $\lambda^0 = \lambda_K = \lambda$. Then for all $\bar{A} \in V_{\lambda+1}$ such that for all $i$, $J^i(\bar{A}) = J^i(\bar{A})$, $K(\bar{A} \cap V_\kappa) = (k_0 \circ \cdots \circ k_{n-1})(\bar{A} \cap V_\kappa)$.

Proof. Let $J^0(\bar{A}) = A$ and let $\langle i_n \mid n < \omega \rangle$ be a common part index sequence for $\langle J^i \mid i < \omega \rangle$. It is enough to show that for cofinally many $\bar{\kappa} < \lambda$, $K(\bar{A} \cap V_\kappa) = A \cap V_\kappa$, where $\kappa = K(\bar{\kappa})$. Let $\bar{\kappa} < \lambda$, and let $n < \omega$ be least such that $\text{crit}(k_n) > \bar{\kappa}$. Then we have that

$$K(\bar{A} \cap V_\kappa) = (k_0 \circ \cdots \circ k_{n-1})(\bar{A} \cap V_\kappa).$$

On the other hand, for some $\kappa^* < \lambda$,

$$A \cap V_{\kappa^*} = J^{i_n}(\bar{A} \cap V_\kappa) = (j_0^{i_n} \circ \cdots \circ j_{n-1}^{i_n})(\bar{A} \cap V_\kappa) = (k_0 \circ \cdots \circ k_{n-1})(\bar{A} \cap V_\kappa).$$

And hence $\kappa^* = K(\bar{\kappa})$, and $K(\bar{A} \cap V_\kappa) = A \cap V_{\kappa^*}$, as desired.

It is possible that if $K$ is the common part of $\langle J^i \mid i < \omega \rangle$ then $\lambda_K < \lambda$. To avoid this possibility, we can fix a sequence $\langle \lambda_n \mid n < \omega \rangle$ cofinal in $\lambda$. Then we add to our requirement on $J^{i+1}$ that for all $m < \omega$ if $n$ is largest such that $\text{crit} j_m^i \lambda > \lambda_n$, then $\text{crit} j_m^{i+1} > \lambda_n$. In this case we say that $J^{i+1}$ is a limit root of $J^i$, supported by $\langle \lambda_n \mid n < \omega \rangle$.

Definition 2.1.17. Suppose $E \subseteq \mathcal{E}$ is a set of inverse limits. Then we let $CL(E)$ be the set

$$CL(E) = \{(K, \bar{K}) \in \mathcal{E} \mid \exists \bar{K}(K \text{ is the common part of } \bar{K}, \lambda_K = \lambda) \text{ and } \forall i < \omega ((K^i, \bar{K}^i) \in E)\}.$$
2.2 Reflecting $I_1$

In the next several sections we will use inverse limits to prove a number of reflection results. These will culminate in Section 2.5 where we will show that $I_0^#$ reflects $I_0$. That proof is in fact independent of the proofs in the preceding sections, and the reader can skip to that proof if desired. However the following progression of proofs provides a more gentle introduction to using inverse limits and therefore can help motivate the methods of the final proof.

In this section, as an introduction to the use of inverse limits for reflecting large cardinals, we prove the following theorem of Laver.

**Theorem 2.2.1 (Laver).** Suppose $(J, \vec{j})$ is an inverse limit such that for all $i$,

$$j_i : V_{\lambda+1} \to V_{\lambda+1}$$

is elementary. Then $J : V_{\lambda, j+1} \to V_{\lambda+1}$ is elementary.

The key tool is the following square root lemma.

**Lemma 2.2.2 (Martin).** Fix $n > 0$ odd. Suppose that $j : V_{\lambda+1} \to V_{\lambda+1}$ is $\Sigma_n$-elementary. Let $a, b \in V_{\lambda+1}$ and $\alpha < \text{crit}(j)$. Then there is $k : V_{\lambda+1} \to V_{\lambda+1}$ which is $\Sigma_{n-2}$-elementary if $n > 1$ and $\Sigma_0$-elementary if $n = 1$ such that $k(a) = j(a), b \in \text{rng } k$ and $\alpha < \text{crit } (k) < \text{crit } (j)$.

**Proof.** First suppose that $n = 1$. We first note that the elementary embeddings $V_{\lambda} \to V_{\lambda}$ are the branches of a tree on $V_{\lambda}$. Furthermore, the elementary embeddings $k : V_{\lambda} \to V_{\lambda}$ such that $k(a) = j(a), b \in \text{rng } k,$ and $\alpha < \text{crit } (k) < \text{crit } (j)$ are also the branches of a tree $T$ on $V_{\lambda}$. So we just need to show that this tree is not well founded. But we must have that $j$ is an infinite branch of $j(T)$. And hence by the $\Sigma_1$-elementarity of $j$, we have that $T$ must have an infinite branch.

Now suppose that $n > 1$. The main point is that the statement ‘$k : V_{\lambda+1} \to V_{\lambda+1}$ is $\Sigma_{n-2}$’ is $\Pi_{n-1}$ over $V_{\lambda+1}$. Hence the existence of such an embedding $k$ such that $k(a) = j(a), b \in \text{rng } k$ and $\alpha < \text{crit } (k) < \text{crit } (j)$ is $\Sigma_n$. So applying $j$ to this statement, we want an embedding $k$ such that

$$k(j(a)) = j(j)(j(a)) = j(j(a)),$$

$$j(b) \in \text{rng } k$$

$$j(\alpha) = \alpha < \text{crit } (k) < \text{crit } j(j).$$

But $j$ is such a witness, so pulling back the statement by $j$, we are done. \hfill $\square$

**Lemma 2.2.3 (Martin).** Suppose that $j : V_{\lambda+1} \to V_{\lambda+1}$ is $\Sigma_n$ elementary for $n$ odd. Then $j$ is $\Sigma_{n+1}$ elementary.
Proof. We prove this by induction on $n$. First suppose $n = 1$. Suppose that $V_{\lambda+1} \models \exists x \phi[x, a]$ where $\phi$ is $\Pi_1$. Then we want to show that $V_{\lambda+1} \models \exists x \phi[x, j(a)]$. But if $x_0$ is a witness then we must have that $V_{\lambda+1} \models \phi[x_0, a]$ implies $V_{\lambda+1} \models \phi[j(x_0), j(a)]$ as $j$ is $\Sigma_1$-elementary.

For the converse, suppose that

$$V_{\lambda+1} \models \exists x \phi[x, j(a)]$$

where $\phi$ is $\Pi_1$. Let $x_0$ be a witness to this. We have that by Lemma 2.2.2 there is a $k : V_{\lambda+1} \rightarrow V_{\lambda+1}$ such that $x_0 \in \text{rng} \, k$ and $j(a) = k(a)$ and $k$ is $\Sigma_0$-elementary. So since $\phi$ is $\Pi_1$,

$$V_{\lambda+1} \models \neg \phi[k^{-1}(x_0), a] \Rightarrow V_{\lambda+1} \models \neg \phi[x_0, j(a)].$$

Hence

$$V_{\lambda+1} \models \phi[x_0, j(a)] \Rightarrow V_{\lambda+1} \models \phi[k^{-1}(x_0), a],$$

and so $V_{\lambda+1} \models \exists x \phi[x, a]$ as we wanted.

Assume $n > 1$. Suppose that $V_{\lambda+1} \models \exists x \phi[x, a]$ where $\phi$ is $\Pi_n$. Then we want to show that $V_{\lambda+1} \models \exists x \phi[x, j(a)]$. But if $x_0$ is a witness then we must have that $V_{\lambda+1} \models \phi[x_0, a]$ implies $V_{\lambda+1} \models \phi[j(x_0), j(a)]$ as $j$ is $\Sigma_n$-elementary.

For the converse, suppose that $V_{\lambda+1} \models \exists x \phi[x, j(a)]$ where $\phi$ is $\Pi_n$. Let $x_0$ be a witness to this. We have that there is a $k : V_{\lambda+1} \rightarrow V_{\lambda+1}$ such that $x_0 \in \text{rng} \, k$ and $j(a) = k(a)$ and $k$ is $\Sigma_{n-2}$-elementary. So by induction $k$ is $\Sigma_{n-1}$-elementary. So since $\phi$ is $\Pi_n$,

$$V_{\lambda+1} \models \phi[x_0, j(a)] \Rightarrow V_{\lambda+1} \models \phi[k^{-1}(x_0), a].$$

So $V_{\lambda+1} \models \exists x \phi[x, a]$ as we wanted. \hfill \Box

We now show that inverse limits have a corresponding square root property.

**Lemma 2.2.4** (Laver). Suppose $(J, \vec{J})$ is an inverse limit such that for all $i$, $j_i : V_{\lambda+1} \rightarrow V_{\lambda+1}$ is $\Sigma_{n+2}$-elementary. Then for all $a \in V_{\lambda+1}$ and $b \in V_{\lambda+1}$ there is a $(K, \vec{K})$ such that for all $i$, $k_i : V_{\lambda+1} \rightarrow V_{\lambda+1}$ is $\Sigma_{n}$-elementary, $\lambda_j = \lambda K$, $j(a) = K(a)$ and $b \in \text{rng} \, K$.

**Proof.** Choose a sequence $k_i, b_i$ for $i < \omega$ such that the following hold:

1. $k_0(b_0) = b$.
2. For all $i < \omega$, $k_{i+1}(b_{i+1}) = b_i$.
3. For all $i < n < \omega$, $k_i((j_{i+1} \circ \cdots \circ j_{n-1})(a)) = j_i((j_{i+1} \circ \cdots \circ j_{n-1})(a))$.
4. For all $i < \omega$, $\text{crit} \, (j_i) < \text{crit} \, (k_{i+1}) < \text{crit} \, (j_{i+1})$.
5. For all $i < \omega$, $k_i : V_{\lambda+1} \rightarrow V_{\lambda+1}$ is $\Sigma_n$-elementary.
We claim that \((K, \vec{k})\) witnesses the lemma holds. We have by construction that \((K, \vec{k})\) is an inverse limit and \(\bar{\lambda}_J = \bar{\lambda}_K\). We want to show that \(K(a) = J(a)\) and \(b \in \text{rng} K\). To see that \(K(a) = J(a)\), it is enough to show that for all \(\kappa < \bar{\lambda}\), that \(K(a \cap V_\kappa) = J(a \cap V_\kappa)\). Let \(i < \omega\) be large enough so that crit \((j_i) > \text{crit} (k_i) > \kappa\). Let \(a^* = a \cap V_\kappa\). Then we have that

\[
J(a^*) = (j_0 \circ \cdots \circ j_{i-1})(a^*) = k_0((j_1 \circ \cdots \circ j_{i-1})(a^*)) = k_0(k_1((j_2 \circ \cdots \circ j_{i-1})(a^*))) = \cdots
\]

\[
= (k_0 \circ \cdots \circ k_{i-1})(a^*) = K(a^*).
\]

Now we want to see that \(b \in \text{rng} K\). In fact, let \(\bar{b} = \lim_{i \to \omega} b_i\). We show that \(K(\bar{b}) = b\). It is enough to show that for all \(\kappa < \bar{\lambda}\) that \(\bar{K}(\bar{b} \cap V_\kappa) = b \cap V_{K(\kappa)}\). Let \(b^* = b \cap V_\kappa\). Let \(i < \omega\) be large enough so that crit \((k_i) > \kappa\). Then we have that

\[
K(b^*) = (k_0 \circ \cdots \circ k_{i-1})(b^*) = (k_0 \circ \cdots \circ k_{i-1})(b_i \cap V_\kappa) = b \cap V_{K(\kappa)}
\]

which is what we wanted. Hence \((K, \vec{k})\) witnesses the lemma.

We finally prove the following by induction, from which Theorem 2.2.1 follows immediately.

**Theorem 2.2.5 (Laver).** Fix \(n < \omega\). Suppose \((J, \vec{j})\) is an inverse limit such that for all \(i, j_i : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\) is \(\Sigma_n\)-elementary. Then \(J : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\) is \(\Sigma_n\)-elementary.

**Proof.** The case \(n = 0\) is immediate from the fact that \(\sup_{\alpha < \bar{\lambda}} J(\alpha) = \lambda\). Assuming the theorem for \(n – 1\) we prove it for \(n\).

So suppose \((J, \vec{j})\) is an inverse limit such that for all \(i, j_i : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\) is \(\Sigma_n\)-elementary. Then \(J : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\) is \(\Sigma_{n-1}\)-elementary by induction and preserves \(\Sigma_n\) statements upwards. We show that it preserves \(\Sigma_n\) statements downwards.

Suppose that \(V_{\lambda_{i+1}} \models \exists \exists x \phi(x, J(a))\) where \(\phi\) is \(\Pi_{n-1}\). Let \(x_0\) be a witness, and let \((K, \vec{k})\) be such that \(K(a) = J(a), x_0 \in \text{rng} K, \bar{\lambda}_J = \bar{\lambda}_K\), and for all \(i, k_i : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\) is \(\Sigma_{n-2}\) (or \(\Sigma_0\) if \(n = 1\)). Then \(K\) preserves \(\Pi_{n-1}\) statements downwards, and hence

\[
V_{\lambda_{i+1}} \models \phi(x_0, J(a)) \Rightarrow V_{\lambda_{i+1}} \models \phi(K^{-1}(x_0), a).
\]

So we have that \(J\) is \(\Sigma_n\) as desired.

We can now use the proof of Theorem 2.2.1 to reflect the axiom \(I_1\).

**Theorem 2.2.6 (Laver).** Suppose there exists an elementary embedding \(j : L_1(V_{\lambda_{i+1}}) \rightarrow L_1(V_{\lambda_{i+1}})\). Then there exists a \(\lambda < \lambda\) and an elementary embedding \(k : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\).

**Proof.** By the proofs of Lemmas 2.1.4 and 2.1.7 there exists \((J, \vec{j}) \in \mathcal{E}\) such that \(J(\vec{j}) = j \upharpoonright V_\lambda\). Furthermore by Theorem 2.2.1, \(J : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\) is elementary. By elementarity, we have that \(\vec{j} : V_\lambda \rightarrow V_\lambda\) is elementary and that \(\vec{j}\) extends to a \(\Sigma_0\)-elementary embedding \(\vec{j}^* : V_{\lambda_{i+1}} \rightarrow V_{\lambda_{i+1}}\). We show that \(\vec{j}^*\) is fully elementary.
To see this this suppose that $\phi$ is a $\Sigma_n$-formula and $\bar{a} \in V_{\lambda+1}$. We wish to show that $V_{\lambda+1} \models \phi[\bar{a}]$ if and only if $V_{\lambda+1} \models \phi[j^*(\bar{a})]$. But we have that

$$V_{\lambda+1} \models \phi[J(\bar{a})] \iff V_{\lambda+1} \models \phi[j(J(\bar{a}))] \iff V_{\lambda+1} \models \phi[J(j^*(\bar{a}))].$$

So by elementarity of $J$ we have

$$V_{\lambda+1} \models \phi[\bar{a}] \iff V_{\lambda+1} \models \phi[j^*(\bar{a})].$$

And hence $j^*$ is elementary as desired.

\[\square\]

## 2.3 Reflecting below the least admissible

Laver in fact extended Theorem 2.2.1 significantly beyond reflecting $I_1$. For instance he showed the following.

**Theorem 2.3.1** (Laver). Suppose that $(J, \tilde{J}) \in \mathcal{E}_{\lambda^+\omega}$. Then $J : V_{\lambda+1} \to V_{\lambda+1}$ extends to an elementary embedding

$$\tilde{J} : L_{\lambda^+}(V_{\lambda+1}) \to L_{\lambda^+}(V_{\lambda+1}).$$

The proof uses projective prewellorderings to code how the extension should map ordinals, and so the result extends in fact to the sup of the projective prewellorderings of $V_{\lambda+1}$. We do not present this proof, and instead we prove a similar result up to the least admissible, a point which is strictly beyond the sup of the projective prewellorderings. Instead of using prewellorderings to guide the extension on ordinals, we use the failure of admissibility and the corresponding local surjections of $V_{\lambda+1}$ onto the levels of $L(V_{\lambda+1})$ as a guide.

The following is an obvious generalization of the technique of Martin used above.

**Lemma 2.3.2.** Suppose that $\bar{M}$ and $M$ are transitive sets, $\bar{X} \subseteq \bar{M}$ and $X \subseteq M$. Suppose $\langle E_i \mid i < \omega \rangle$ is such that

1. For $i < \omega$, $E_i \supseteq E_{i+1}$.
2. For all $i$, for all $j \in E_i$, $j : (\bar{M}, \bar{X}) \to (M, X)$ is a $\Sigma_0$-elementary embedding.
3. For all $i$ and $n$, $j \in E_{i+1}$, $\bar{a}_1, \ldots, \bar{a}_n \in \bar{M}$, $b_1, \ldots, b_n \in M$, there exists $k \in E_i$ such that for all $m$, $1 \leq m \leq n$,

$$j(\bar{a}_m) = k(\bar{a}_m) \text{ and } b_m \in \text{rng}(k).$$

Then for all $i$, if $j \in E_i$, $j : (\bar{M}, \bar{X}) \to (M, X)$ is $\Sigma_i$ elementary. And hence for $j \in \bigcap_i E_i$, $j$ is elementary.
Proof. We prove the lemma by induction. The case \( i = 0 \) is by assumption. Assume it true for \( i \). We prove it for \( i + 1 \). Let \( j \in E_{i+1} \). We want to show that \( j \) is \( \Sigma_{i+1} \)-elementary. Suppose that \( M \models \exists x \phi(x,j(\bar{a}),X) \) for \( \bar{a} \in \bar{M} \) and \( \phi \) a \( \Pi_i \)-formula. Let \( x_0 \) be a witness, and let \( k \in E_i \) be such that \( j(\bar{a}) = k(\bar{a}) \) and \( x_0 \in \text{rng}(k) \), say \( k(\bar{x}_0) = x_0 \). Then we have

\[
(M, X) \models \phi(x_0, j(\bar{a}), X) \Rightarrow (\bar{M}, \bar{X}) \models \phi(\bar{x}_0, \bar{a}, \bar{X}),
\]

using that by induction \( k \) is \( \Sigma_i \)-elementary. Hence \( (\bar{M}, \bar{X}) \models \exists x \phi(x,\bar{a},\bar{X}) \).

Now for the opposite direction assume that \((\bar{M}, \bar{X}) \models \exists x \phi(x,\bar{a},\bar{X})\). Then if \( \bar{x}_0 \in \bar{M} \) is a witness, we have that since \( j \) is \( \Sigma_i \),

\[
(\bar{M}, \bar{X}) \models \phi(\bar{x}_0, \bar{a}, \bar{X}) \Rightarrow (M, X) \models \phi(j(\bar{x}_0), j(\bar{a}), X).
\]

So \((M, X) \models \exists x \phi(x,j(\bar{a}),X)\).

Hence \( j \) is \( \Sigma_{i+1} \) elementary, and by induction we are done. \( \square \)

The following is a slight generalization of the technique of Laver used above.

Lemma 2.3.3. Suppose that \( \bar{M} \) and \( M \) are transitive sets, \( \bar{X} \subseteq \bar{M} \) and \( X \subseteq M \). Suppose \( \langle E_i \mid i < \omega \rangle \) is such that

1. For all \( i \), for all \( (J, \langle j_i \mid i < \omega \rangle) \in E_i \), \( J : (\bar{M}, \bar{X}) \rightarrow (M, X) \) is a \( \Sigma_0 \)-elementary embedding, and for all \( i \), \( j_i : (M, X_{i+1}) \rightarrow (M, X_i) \) is an elementary embedding, where for \( i < \omega \), \( X_i \subseteq M \) and \( X_0 = X \). And for all \( i \) there exists \( J_i : (\bar{M}, \bar{X}) \rightarrow (M, X_i) \) such that

\[
J = j_0 \circ \cdots \circ j_i \circ J_{i+1}.
\]

2. For all \( i \) and \( n_0 \), \( (J, \langle j_i \mid i < \omega \rangle) \in E_{i+1} \), \( \bar{a}_0, \ldots, \bar{a}_{n_0} \in \bar{M} \), \( b = \langle b_n \mid n < \omega \rangle \) such that \( b_n \in M \) for \( n < \omega \), there exists \( (K, \langle k_i \mid i < \omega \rangle) \in E_i \) and \( i_0 < \omega \) such that for all \( m, 1 \leq m \leq n_0 \),

\[
J_{i_0}(\bar{a}_m) = K_{i_0}(\bar{a}_m) \text{ and } \forall n < \omega (b_n \in \text{rng}(K_{i_0})).
\]

Then for all \( i \), if \((J, \langle j_i \mid i < \omega \rangle) \in E_i \), then \( J : (\bar{M}, \bar{X}) \rightarrow (M, X) \) is \( \Sigma_i \) elementary. And hence for \((J, \langle j_i \mid i < \omega \rangle) \in \bigcap E_i \), \( J \) is elementary.

Proof. We prove the lemma by induction in a similar fashion as the proof of Lemma 2.3.2. The case \( i = 0 \) is by assumption. Assume it true for \( i \). We prove it for \( i + 1 \). Let \((J, \langle j_i \rangle) \in E_{i+1} \). We want to show that \( J \) is \( \Sigma_{i+1} \)-elementary. Suppose that \( M \models \exists x \phi(x,J(\bar{a}),X) \) for \( \bar{a} \in \bar{M} \) and \( \phi \) a \( \Pi_i \) formula. Then for all \( i \), we have that

\[
M \models \exists x \phi(x, J_i(\bar{a}), X_i).
\]

For \( i < \omega \), let \( x_i \) be a witness to the formula with parameters \( J_i(\bar{a}) \) and \( X_i \). Let \((K, \langle k_i \rangle) \in E_i \) be such that for some \( i_0 < \omega \), \( J_{i_0}(\bar{a}) = K_{i_0}(\bar{a}) \) and \( x_i \in \text{rng}(K_{i_0}) \) for all \( i < \omega \), say \( K_{i_0}(\bar{x}_i) = x_i \). Then we have

\[
(M, X) \models \phi(x_{i_0}, J_{i_0}(\bar{a}), X_{i_0}) \Rightarrow (\bar{M}, \bar{X}) \models \phi(\bar{x}_{i_0}, \bar{a}, \bar{X}),
\]
using that by induction \( K \) is \( \Sigma_i \). Hence \( (M, \bar{X}) \models \exists x \phi(x, \bar{a}, \bar{X}) \).

The opposite direction is exactly same as in the proof of Lemma 2.3.2. Hence \( J \) is \( \Sigma_{i+1} \) elementary, and by induction we are done. \( \square \)

We will mostly be using Jensen’s \( J \)-hierarchy to stratify \( L(V_{\lambda+1}) \). The above results hold for the \( J \)-hierarchy with the same proofs, and we will use these analogous results without comment. We will also use the following stronger notion of goodness.

**Definition 2.3.4.** Call an ordinal \( \alpha \) strongly good if it is not the case that

\[ J_\alpha(V_{\lambda+1}) \prec_{\Sigma_1} (V_{\lambda+1} \cup \{V_{\lambda+1}\}) J_{\alpha+1}(V_{\lambda+1}). \]

For \( \alpha \) strongly good, \( A \in V_{\lambda+1} \) and \( \phi \) a \( \Sigma_1 \) formula, say that \((A, \phi)\) \( \lambda \)-tags \( \alpha \) if \( \alpha \) is least such that

\[ J_{\alpha+1}(V_{\lambda+1}) \models \phi[A, V_{\lambda+1}]. \]

Much of the time it will be easier to work with structures of the form \((V_{\lambda+1}, X)\) for \( X \subseteq V_{\lambda+1} \). Along these lines, we make the following definition.

**Definition 2.3.5.** Suppose that \( X \subseteq V_{\lambda+1} \). Let \( \mathcal{E}(X) \) be the set

\[ \mathcal{E}(X) := \{(J, \bar{j}) \mid \forall i < \omega \, (j_i : (V_{\lambda+1}, X) \rightarrow (V_{\lambda+1}, X) \text{ is elementary}), \]
\[ \exists \bar{\lambda} < \lambda, \bar{X} \in V_{\lambda+1} \, (\text{crit} (j_0) < \text{crit} (j_1) < \cdots < \bar{\lambda}), \]
\[ \lim_{i \rightarrow \omega} \text{crit} (j_i) = \bar{\lambda}, J = j_0 \circ j_1 \circ \cdots, \text{ and} \]
\[ J : (V_{\lambda+1}, \bar{X}) \rightarrow (V_{\lambda+1}, X) \text{ is \( \Sigma_0 \)-elementary}) \}. \]

We use the terminology limit root, saturated, etc. with the obvious definitions for \( \mathcal{E}(X) \).

**Lemma 2.3.6.** Suppose \( X \subseteq V_{\lambda+1} \) and \( E \subseteq \mathcal{E}(X) \) is saturated. Suppose that \( \bar{X} \subseteq V_{\lambda+1}, X \subseteq V_{\lambda+1}, A \in V_{\lambda+1} \) and \( \bar{A} \in V_{\lambda+1} \) are such that for all \((J, \bar{j}) \in E \) with \( J(\bar{A}) = A \) we have

\[ J : (V_{\lambda+1}, \bar{X}) \rightarrow (V_{\lambda+1}, X) \]

is \( \Sigma_0 \)-elementary. Furthermore assume that for all \((J, \bar{j}) \in E \) and \( i < \omega \), \( j_i \) extends to an elementary embedding \( J_i(V_{\lambda+1}, X) \rightarrow (V_{\lambda+1}, X) \). Then there is a unique extension \( \bar{J} : J_i(V_{\lambda+1}, \bar{X}) \rightarrow J_i(V_{\lambda+1}, X) \) which is elementary. And hence if \( \kappa < \Theta_\lambda \), \( \alpha < \kappa, \bar{\alpha} \) and \( \phi \) are such that \((A, \phi)\) \( \lambda \)-tags \( \alpha \), and such that \( \bar{X} \) and \( \bar{X} \) code \( J_\alpha(V_{\lambda+1}) \) and \( J_\alpha(V_{\lambda+1}) \) respectively, then \((\bar{A}, \phi)\) \( \lambda \)-tags \( \bar{\alpha} \).

**Proof.** This follows from Lemma 2.3.3 with \( E_i = E \) for all \( i \). The Lemma immediately gives us elementarity of the maps \( J : (V_{\lambda+1}, X) \rightarrow (V_{\lambda+1}, X) \) for \( J \in E \). Hence we have that \( J \in E \) extends uniquely to \( \bar{J} : J_i(V_{\lambda+1}, X) \rightarrow J_i(V_{\lambda+1}, X) \) is \( \Sigma_0 \). We similarly get by induction that \( J \in E \) extends to \( J_n(V_{\lambda+1}, X) \rightarrow J_n(V_{\lambda+1}, X) \) for any \( n < \omega \). So the rest of the lemma follows. \( \square \)
Remark 2.3.7. At first glance it might seem as though Lemma 2.3.6 gives a straightforward generalization of Theorem 2.2.1 to any \( X \subseteq V_{\lambda+1} \), showing that for any \((J, \vec{j}) \in \mathcal{E}(X)\), if there exists a saturated \( E \subseteq \mathcal{E}(X) \) with \((J, \vec{j}) \in E\), then there exists an \( \bar{X} \subseteq V_{\lambda+1} \) such that

\[
J : (V_{\lambda+1}, X) \rightarrow (V_{\lambda+1}, \bar{X})
\]
is elementary. This is not the case, however, with the key point being that the hypothesis of Lemma 2.3.6 requires a \textit{fixed} \( \bar{X} \) for all elements of \( E \). In fact almost all of the reflection proofs below boil down to fixing this \( \bar{X} \). Furthermore, we will see that such a general \( X \)-reflection result does not hold (see Corollary 2.5.11).

Recall an ordinal \( \alpha \) is \textit{admissible relative to} \( V_{\lambda+1} \) if \( \alpha \) is a limit and \( J_\alpha(V_{\lambda+1}) \) satisfies \( \Sigma_0 \)-collection. We use the following standard property of admissibility:

**Lemma 2.3.8.** Suppose \( \kappa \) is the least admissible relative to \( V_{\lambda+1} \) and that \( \alpha < \kappa \). Then there exists a surjection \( \sigma : a \rightarrow J_\alpha(V_{\lambda+1}) \) such that \( a \subseteq V_{\lambda+1} \), \( a \in J_\alpha(V_{\lambda+1}) \), and \( \sigma \) is \( \Sigma_1 \)-definable over \( J_\alpha(V_{\lambda+1}) \) from some parameter \( B \in V_{\lambda+1} \).

**Sketch.** We prove this by induction on \( \alpha \). Assume that for all \( \beta < \alpha \) there is a surjection \( \sigma : b \rightarrow J_\beta(V_{\lambda+1}) \) such that \( b \in J_\beta(V_{\lambda+1}) \), \( b \subseteq V_{\lambda+1} \), and \( \sigma \) is \( \Sigma_1 \)-definable over \( J_\beta(V_{\lambda+1}) \) from some parameter \( B \in V_{\lambda+1} \). Since \( \alpha \) is not admissible there is a cofinal map \( \sigma : a \rightarrow \alpha \) \( \Sigma_0 \)-definable over \( J_\alpha(V_{\lambda+1}) \) where \( a \in J_\alpha(V_{\lambda+1}) \). We can assume that \( a \subseteq V_{\lambda+1} \) by induction. But then we can define a surjection onto \( J_\alpha(V_{\lambda+1}) \) from

\[
\bigcup_{x \in a, B \in V_{\lambda+1}} \{x\} \times \{B\} \times a_{\sigma(x), B} \rightarrow J_\alpha(V_{\lambda+1})
\]

by \((x, B, C)\) maps to \( \tau_{B, \sigma(x)}(C) \) where \( \tau_{B, \beta} \) is the least \( \Sigma_1 \)-definable from \( B \) surjection of an element \( a_{\beta, B} \in J_\beta(V_{\lambda+1}) \) onto \( J_\beta(V_{\lambda+1}) \) such that \( a_{\beta, B} \subseteq V_{\lambda+1} \).

For \( A \in V_{\lambda+1} \) and \( \phi \) a \( \Sigma_1 \) formula, we say that \((A, \phi)\) \( \lambda \)-tags \( \alpha \) if \( \alpha \) is least such that \( J_{\alpha+1}(V_{\lambda+1}) \models \phi(A) \).

**Theorem 2.3.9.** Let \( \kappa \) be the least admissible relative to \( V_{\lambda+1} \). Suppose that there exists an elementary embedding

\[
j : J_{\kappa+1}(V_{\lambda+1}) \rightarrow J_{\kappa+1}(V_{\lambda+1}).
\]

Then there exists \( \bar{\lambda} < \lambda \) such that for all \( \alpha < \kappa \) there exists \( \bar{\alpha} < \lambda \) and an elementary embedding

\[
J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_{\alpha}(V_{\lambda+1}).
\]

**Proof.** First using the fact that there is an elementary embedding

\[
j : J_{\kappa+1}(V_{\lambda+1}) \rightarrow J_{\kappa+1}(V_{\lambda+1}),
\]
there must be a sequence of elementary embeddings $\langle j_i : i < \omega \rangle$ such that for all $i$,

$$j_i : J_\kappa(V_{\lambda+1}) \to J_\kappa(V_{\lambda+1}),$$

and such that

$$\text{crit}(j_0) < \text{crit}(j_1) < \cdots < \text{crit}(j) < \lambda.$$ 

Hence letting $\bar{\lambda} = \sup_{i<\omega} \text{crit}(j_i)$, we have that $\bar{\lambda} < \lambda$. We fix this $\bar{\lambda}$. Let

$$E^e = \{ (K, \langle k_i | i < \omega \rangle) \mid \forall i \exists \alpha_i (\alpha_i \text{ is good and } k_i : J_{\alpha_i}(V_{\lambda+1}) \to J_{\alpha_i}(V_{\lambda+1})),$$

$$\text{crit}(k_0) < \text{crit}(k_1) < \cdots \uparrow \bar{\lambda}, \text{ and } K = k_0 \circ k_1 \circ \cdots \}.$$ 

And let for $\beta$ an ordinal,

$$E^e_{\geq \beta} = \{ (K, \langle k_i | i < \omega \rangle) \in E^e \mid \forall i \exists \gamma_i \geq \beta (\gamma_i \text{ is good and } k_i : J_{\gamma_i}(V_{\lambda+1}) \to J_{\gamma_i}(V_{\lambda+1})) \},$$

and

$$E^e_{= \beta} = \{ (K, \langle k_i | i < \omega \rangle) \in E^e \mid \forall i (j_i(\beta) = \beta \text{ or } k_i : J_{\beta}(V_{\lambda+1}) \to J_{\beta}(V_{\lambda+1})) \}.$$ 

We define by induction for each $(J, \langle j_i | i < \omega \rangle) \in E^e$, a function $\pi_J$ on ordinals (we omit the $\langle j_i | i < \omega \rangle$ from the notation, though it does depend on $\langle j_i \rangle$).

Let $\Phi(\alpha)$ be the statement that for all $\alpha' < \alpha$ we have:

For all $(J, \langle j_i | i < \omega \rangle) \in E^e_{\geq \omega^\omega + \omega + 1}$ if $(A, \phi) \lambda$-tags $\alpha'$ and $J(\bar{A}) = A$ for some $\bar{A} \in V_{\lambda+1}$, then there exists $\bar{\alpha}$ such that $(\bar{A}, \phi) \lambda$-tags $\bar{\alpha}$, $\pi_J(\bar{\alpha}) = \alpha'$, and $\pi_J \upharpoonright \bar{\alpha}$ extends to

$$\bar{J} : J_{\bar{\alpha}}(V_{\lambda+1}) \to J_{\alpha'}(V_{\lambda+1})$$

which is elementary.

Now suppose that $\Phi(\alpha)$ holds and $\alpha < \kappa$ is a limit. Then we extend the definition of $\pi$ and prove $\Phi(\alpha + 1)$. Suppose that $(J, \langle j_i \rangle) \in E^e_{\geq \omega^\omega + \omega + 1}$, $(A, \phi) \lambda$-tags $\alpha$ and $J(\bar{A}) = A$ for some $\bar{A} \in V_{\lambda+1}$. There are two cases: either for all $i$, $j_i(\alpha) = \alpha$, or not:

First assume that this is not the case, so there exists an $i$ such that $j_i(\alpha) > \alpha$. Then we have for

$$A_i := (j_0 \circ \cdots \circ j_i)^{-1}(A), \ \alpha_i := (j_0 \circ \cdots \circ j_i)^{-1}(\alpha)$$

that for all $i$, $(A_i, \phi)$ $\lambda$-tags $\alpha_i$ (note that $\alpha \in \text{rng}(j_0 \circ \cdots \circ j_i)$ since it is definable from $A_i$ in $J_\beta(V_{\lambda+1})$ for any $\beta > \alpha$). But then by assumption there is some $i$ such that $\alpha_i < \alpha$. So by our induction hypothesis applied to $J_{i+1}$ we have that $\pi_{J_{i+1}}(\bar{\alpha}) = \alpha_i$ for some $\bar{\alpha}$ such that $(\bar{A}, \phi) \lambda$-tags $\bar{\alpha}$. And so setting $\pi_J(\bar{\alpha}) = (j_0 \circ \cdots \circ j_i \circ \pi_{J_{i+1}})(\bar{\alpha})$, we are done by the elementarity of $j_0, \ldots, j_i$. 
Now assume that for all \( i, j_i(\alpha) = \alpha \). Then \((J, \langle j_i \mid i < \omega \rangle) \in E_{\omega_\alpha+\omega+1}^e\). Recall that \((A, \phi)\) \(\lambda\)-tags \(\alpha\). Let \( p \in J_{\alpha+1}(V_{\lambda+1}) \) be a witness to \(\phi\) with parameter \(A\). Let \( s \in J_{\alpha}(V_{\lambda+1}) \) be such that \( p \) is definable over \( J_{\alpha}(V_{\lambda+1}) \) from \( s \).

Since \(\alpha < \kappa\) there is a surjection \(\sigma : a \to J_{\alpha}(V_{\lambda+1})\) such that \(a \subseteq V_{\lambda+1}\), \(a \in J_{\alpha}(V_{\lambda+1})\) and \(\sigma = \Sigma_1(J_{\alpha}(V_{\lambda+1}))\) from some parameter \(b \in V_{\lambda+1}\). Let \(\alpha' < \alpha\) be such that \(a, b\), and \(s\) are definable over \( J_{\alpha'}(V_{\lambda+1}) \) from \(J_{\alpha'}(V_{\lambda+1})\) from formulas \(\psi_1, \psi_2, \psi_3\) and parameters \(B_1, B_2, B_3 \in V_{\lambda+1}\), respectively. Let \((A', \phi')\) \(\lambda\)-tag \(\alpha'\). By Lemma 2.1.7 there is \(K \in E_{\omega_\alpha+\omega}^e\) such that

\[
K(\bar{A}) = J(\bar{A}), K(\bar{B}_1) = B_1, K(\bar{B}_2) = B_2, K(\bar{B}_3) = B_3, K(\bar{A}') = A',
\]

for some \(\bar{B}_1, \bar{B}_2, \bar{B}_3, \bar{A}' \in V_{\lambda+1}\). Let \(\bar{\alpha}'\) be the ordinal which (by induction) is \(\bar{\lambda}\)-tagged by \((\bar{A}', \phi')\). Let \(\bar{a}, \bar{b}, \) and \(\bar{s}\) be defined the same as \(a, b\), and \(s\) but with parameters \(\bar{B}_1, \bar{B}_2, \bar{B}_3\) and over \(J_{\bar{\alpha}'}(V_{\lambda+1})\). Let \(\bar{\sigma}\) have the same definition (over \(L(V_{\lambda+1})\)) as \(\sigma\) (over \(L(V_{\lambda+1})\)) but with parameter \(\bar{b}\). Then (we will prove) there is an \(\bar{\alpha}\) such that \(\bar{\sigma}\) is a surjection of \(\bar{a}\) onto \(J_{\bar{\alpha}}(V_{\lambda+1})\). Define \(\pi_{\bar{\alpha}}(\bar{\alpha}) = \alpha\).

Let \(C \in V_{\lambda+1}\) code \((\bar{A}, B_1, B_2, B_3, \bar{A}')\).

Claim 2.3.10. There is some \(\bar{\alpha}\) such that \(\bar{\sigma}\) is a surjection of \(\bar{a}\) onto \(J_{\bar{\alpha}}(V_{\lambda+1})\).

Proof. Now let \(\bar{\alpha}\) be least such that \(\sigma''\bar{a} \subseteq J_{\bar{\alpha}}(V_{\lambda+1})\). We claim that \(\bar{\sigma}\) is a surjection onto \(J_{\bar{\alpha}}(V_{\lambda+1})\). Suppose that \(\bar{s} \in J_{\bar{\alpha}}(V_{\lambda+1})\). We want to show that \(\bar{s} \in \text{rng } \bar{\sigma}\). Let \(\bar{t} < \bar{\alpha}\) be large enough so that \(\bar{s} \in J_{\bar{\alpha}}(V_{\lambda+1})\), and let \(\bar{t} \in J_{\bar{\alpha}}(V_{\lambda+1})\) be such that for some \(\bar{c} \in V_{\lambda+1}\), \(\bar{\sigma}(\bar{c}) = \bar{t}\) and assume \(\bar{t}\) is least such that this is true. Set \(t = \sigma(K(\bar{c}))\), and let \(\beta < \alpha\) be big enough so that \((\sigma)^{J_{\beta}(V_{\lambda+1})}(K(\bar{c})) = t\). Suppose \((B', \phi')\) \(\lambda\)-tags \(\beta\). By Lemma 2.1.7 there is a \(K' \in E_{\omega_\alpha+\omega}^e\) such that

\[
K'(\bar{C}) = K(\bar{C}), K'(\bar{c}) = K(\bar{c}), \hat{K}'(\bar{t}', \bar{B}') = (t, B')
\]

for some \(\bar{t}'\) and \(\bar{B}'\), where by induction

\[
\hat{K}' : J_{\beta}(V_{\lambda+1}) \to J_{\beta}(V_{\lambda+1})
\]

is elementary (to get \(t\) in the range of \(\hat{K}'\), we use Lemma 2.1.7 to get a parameter in \(V_{\lambda+1}\) from which \(s\) is definable over \(J_{\beta}(V_{\lambda+1})\) into the range, and then define \(\bar{s}'\) analogously over \(J_{\beta}(V_{\lambda+1})\) and use the elementarity of \(\hat{K}'\) to show that \(\hat{K}'(\bar{s}') = s\). We will omit this type of argument in the future without much comment). And by elementarity we must have that \(\bar{t}' = \bar{t}\), since \((\sigma)^{J_{\beta}(V_{\lambda+1})}(K(\bar{c})) = t\) implies

\[
\hat{K}'(\bar{t}) = t = (\sigma(K'(\bar{c})))^{J_{\beta}(V_{\lambda+1})} = \hat{K}'((\bar{\sigma}(\bar{c}))^{J_{\beta}(V_{\lambda+1})}) = \hat{K}'(\bar{t}),
\]

the last equality following from the fact that since \(\bar{\sigma}(\bar{c})\) is defined in \(J_{\beta}(V_{\lambda+1})\) (by elementarity), it must be \(\bar{t}\), since \(\bar{\sigma}\) is \(\Sigma_1\)-definable. But then by elementarity we have that
Claim 2.3.11. For all $K' \in \mathcal{E}_{\omega,\alpha+1}$ such that

$$K'(\bar{C}) = K(\bar{C})$$

we have that for all $\bar{\beta}$,

$$\bar{\beta} < \bar{\alpha} \iff \pi_{K'}(\bar{\beta}) < \alpha.$$ 

**Proof.** Both directions of this claim are proved in a similar manner to the previous claim. Suppose $K' \in \mathcal{E}_{\omega,\alpha+1}$ is such that

$$K'(\bar{C}) = K(\bar{C}).$$

We prove the left to right direction first. Suppose $\bar{\beta} < \bar{\alpha}$. Let $(\bar{B}, \varphi) \bar{\lambda}$-tag $\bar{\beta}$. Then there exists $\bar{c} \in \bar{a}$ such that $\bar{\sigma}(\bar{c}) = \bar{\beta}$. Let $\beta = \sigma(K'(\bar{c}))$, and suppose $\gamma < \alpha$ is such that $\beta \in J_\gamma(V_{\lambda+1})$ and $(\sigma)^{J_\gamma(V_{\lambda+1})}(K'(\bar{c})) = \beta$. Then for $K'' \in \mathcal{E}_{\omega,\alpha}$ such that

$$\hat{K}''(\bar{C}, \bar{c}, \bar{B}) = \hat{K}'(\bar{C}, \bar{c}, \bar{B}),$$

and $\hat{K}''(\bar{\gamma}) = \gamma$

for some $\bar{\gamma}$, where by induction

$$\hat{K}'' : J_\gamma(\bar{V}_{\lambda+1}) \to J_\gamma(V_{\lambda+1})$$
is elementary. And we have

$$\beta = (\sigma(K'(\bar{c})))^{J_\gamma(V_{\lambda+1})} = \hat{K}''((\sigma(\bar{c}))^{J_\gamma(V_{\lambda+1})}) = \hat{K}''(\bar{\beta}).$$

Here we use the fact that $K'(\bar{C}) = K(\bar{C})$. So $\pi_{K''}(\bar{\beta}) < \alpha$. It is enough to show that $\pi_{K''}(\bar{\beta}) = \pi_{K''}(\bar{\beta})$. But by elementarity we must have that $(K''(\bar{B}), \varphi)$ $\lambda$-tags $\beta$. And hence by induction, since $K''(\bar{B}) = K'(\bar{B})$, we have $\pi_{K'}(\bar{\beta}) = \pi_{K''}(\bar{\beta}) = \beta$.

Now we prove the right to left direction. Suppose that $\beta := \pi_{K'}(\bar{\beta}) < \alpha$. Then by induction $\hat{K}' : J_\beta(V_{\lambda+1}) \to J_\beta(V_{\lambda+1})$ is elementary. Let $(\bar{B}, \phi)$ $\lambda$-tag $\bar{\beta}$, let $c \in a$ and $\gamma < \alpha$ be such that $(\sigma)^{J_\gamma(V_{\lambda+1})}(c) = \beta$. Then there is a $K'' \in E_{\omega, \alpha}$ such that

$$K''(\bar{C}, \bar{B}) = \hat{K}'(\bar{C}, \bar{B}), K''(\bar{c}) = c,$$

for some $\bar{c}$ and $\bar{\gamma}$. Then by elementarity we have that

$$(\sigma)^{J_\gamma(V_{\lambda+1})}(\bar{c}) = \bar{\beta},$$

which shows that $\bar{\beta} < \bar{\alpha}$. \\

So we have that for any $K' \in E_{\omega, \alpha+1}$ such that $K'(\bar{C}) = K(\bar{C})$, if $\bar{X} \subset V_{\lambda+1}$ and $X \subset V_{\lambda+1}$ are canonical codings of $J_\alpha(V_{\lambda+1})$ and $J_\alpha(V_{\lambda+1})$, respectively; then

$$K' : (V_{\lambda+1}, \bar{X}) \to (V_{\lambda+1}, X)$$

is a $\Sigma_0$-elementary embedding. But then by Lemma 2.3.2 if $K' \in E_{\omega, \alpha+n+1}$ then

$$K' : (V_{\lambda+1}, \bar{X}) \to (V_{\lambda+1}, X)$$

is $\Sigma_n$-elementary. And so since $K \in E_{\omega, \alpha+\omega}$,

$$K : (V_{\lambda+1}, \bar{X}) \to (V_{\lambda+1}, X)$$

is elementary. Hence $K$ extends to a $\Sigma_0$ embedding

$$\hat{K} : J_{\alpha+1}(V_{\lambda+1}) \to J_{\alpha+1}(V_{\lambda+1}).$$

Recall that $p \in J_{\alpha+1}(V_{\lambda+1})$ was a witness to $\phi$ with parameter $A$. If $\bar{p}$ is defined the same as $p$ but with parameter $\bar{s}$, then we must have $\hat{K}(\bar{p}) = p$. And hence by $\Sigma_0$ elementarity, since $p$ witnesses $\phi$ over $J_{\alpha+1}(V_{\lambda+1})$ with parameter $A$, we have that $\bar{p}$ witnesses $\phi$ over $J_{\alpha+1}(V_{\lambda+1})$ with parameter $\bar{A}$. Hence by definition $(\bar{A}, \phi)$ $\bar{\lambda}$-tags $\bar{\alpha}$. So $\bar{\alpha}$ does not depend of the choice of $K$ above.

Now we want to show that $J$ satisfies that for all $\bar{\beta}$,

$$\bar{\beta} < \bar{\alpha} \iff \pi_J(\bar{\beta}) < \alpha.$$
But for any $\beta < \bar{\alpha}$, if $(\bar{B}_4, \psi_4) \lambda$-tags $\bar{\alpha}$, then we could have required above that $K(\bar{B}_4) = J(\bar{B}_4)$. But the above claim showed that $\pi_K(\bar{\beta}) < \alpha$, and hence by elementarity, that $(K(\bar{B}_4), \psi_4) = (J(\bar{B}_4), \psi_4) \lambda$-tags $\pi_K(\bar{\beta})$. But then by induction we have that $\pi_J(\bar{\beta}) = \pi_K(\bar{\beta}) < \alpha$. So we have proved the left to right direction. The right to left direction follows immediately by induction.

The argument we just gave actually proves the following claim:

**Claim 2.3.12.** For all $K' \in E_{\omega \cdot \alpha + 2}$ such that $K'(\bar{A}) = A$ we have that for all $\bar{\beta}$,

$$\bar{\beta} < \bar{\alpha} \iff \pi_{K'}(\bar{\beta}) < \alpha.$$  

Hence as above by Lemma 2.3.2 if $K' \in E_{\omega \cdot \alpha + n + 2}$ and $K'(\bar{A}) = A$ then

$$K': (V_{\bar{\lambda}+1}, \bar{X}) \to (V_{\lambda+1}, X)$$

is $\Sigma_n$-elementary. And so since $J \in E_{\omega \cdot \alpha + \omega}$,

$$J': (V_{\lambda+1}, \bar{X}) \to (\lambda+1, X)$$

is elementary.

Hence we have proved $\Phi(\alpha + 1)$ for the case that $\alpha$ is a limit. For the case that $\alpha = \beta + 1$ is a successor, we set $\pi_J(\bar{\beta} + 1) = \pi_J(\bar{\beta}) + 1$ where $\pi_J(\bar{\beta}) = \beta$. It is straightforward to prove $\Phi(\alpha + 1)$ using Lemma 2.3.2.

So by induction we have $\Phi(\alpha)$ holds for all $\alpha < \kappa$. So since for all $A \in V_{\lambda+1}$ there exists $(J, \langle j_i | i < \omega \rangle) \in E_{\kappa}$ such that $A \in \text{rng} J$ (by varying the $\lambda$ we fixed, if needed), the theorem follows.

As a corollary of the previous proof we have the following:

**Corollary 2.3.13.** Let $\kappa$ be the least admissible. Then for all $\alpha < \kappa$, if $J \in E_{\omega \cdot \alpha + \omega + 1}$ and $J(\bar{A}) = A$ where $A \in V_{\lambda+1}$, $\bar{A} \in V_{\bar{\lambda}+1}$, and $\phi$ are such that $(A, \phi)$ $\lambda$-tags $\alpha$, then $J$ extends to

$$J: J_\alpha(V_{\bar{\lambda}+1}) \to J_\alpha(V_{\lambda+1})$$

where $\bar{\alpha}$ is $\bar{\lambda}$-tagged by $(\bar{A}, \phi)$.

**2.4 Reflecting below the first $\Sigma_1$-gap**

We now extend our reflection results up to the first $\Sigma_1$-gap. The proof again uses simply definable surjections to guide the extensions, but the verification that our extensions are correct is more difficult. Here we use saturated sets to accomplish this step. While our definition above of saturated sets are subsets of $\mathcal{E}$, we use the obvious extension of this definition to $\mathcal{E}_k^e$ for some $\kappa$ good.
Theorem 2.4.1. Let $\kappa$ be least such that $J_\kappa(V_{\lambda+1}) \prec_{\Sigma_1(V_{\lambda+1} \cup \{V_{\lambda+1}\})} J_{\kappa+1}(V_{\lambda+1})$. Suppose there exists an elementary embedding $j : J_{\kappa+\omega+1}(V_{\lambda+1}) \to J_{\kappa+\omega+1}(V_{\lambda+1})$. Then there is $\tilde{\lambda} < \lambda$ such that for all $\alpha < \kappa$, there exists $\bar{\alpha}$ and an elementary embedding

$$\hat{J} : J_{\bar{\alpha}}(V_{\tilde{\lambda}+1}) \to J_{\alpha}(V_{\lambda+1}).$$

Proof. We prove this by induction on $\alpha$. Specifically, for $F_\kappa \subseteq E_\kappa$ a fixed saturated set, we will inductively define for every $J \in F_\kappa$ a function $\pi_J$ on ordinals. Our induction hypothesis for $\alpha$ will be that for all $\alpha' < \alpha$ if $(A, \phi)$ $\lambda$-tags $\alpha'$ and $J \in F_\kappa$ is such that $J(A) = A$, then there exists $\bar{\alpha}$ such that $\pi_J(\bar{\alpha}) = \alpha'$, and $(\bar{A}, \phi)$ $\tilde{\lambda}$-tags $\bar{\alpha}$. Furthermore,

1. $\pi_J | \bar{\alpha}$ extends to an elementary embedding

$$\hat{J} : J_{\bar{\alpha}}(V_{\tilde{\lambda}+1}) \to J_{\alpha'}(V_{\lambda+1}).$$

2. For all $i$,

$$\pi_J | \bar{\alpha} + 1 = j_0 \circ \cdots \circ j_i \circ \pi_{J_{\alpha+1}} | \bar{\alpha} + 1.$$

Let $\tau$ be $\Sigma_1$ definable and such that for all $\alpha < \kappa$, $(\tau)^{J_\alpha(V_{\lambda+1})}$ is a partial function $V_{\lambda+1} \to J_\alpha(V_{\lambda+1})$ which is a surjection (see Steel [Ste83]). Let $\bar{\tau}$ be defined similarly for $\tilde{\lambda}$. By $\tau$ and $\bar{\tau}$ we mean $(\tau)^{L(V_{\lambda+1})}$ and $\bar{\tau}^{L(V_{\tilde{\lambda}+1})}$.

Now assuming the induction hypothesis at $\alpha$, we prove it for $\alpha + 1$. Hence, we need to find for every $J \in F_\kappa$ such that $J(\bar{A}) = A$ for some $\bar{A}$ and $(\bar{A}, \phi)$ which $\lambda$-tags $\alpha$, an appropriate $\bar{\alpha}$. We can again reduce to the case that for all $i$, $j_i(\alpha) = \alpha'$ just as in the proof of Theorem 2.3.9. Let $\bar{\alpha}$ be least such that either:

1. There exists $\bar{a} \in V_{\bar{\lambda}+1}$ such that $\bar{\tau}(\bar{a}) = \bar{\alpha}$, but either

$$J(\bar{a}) \notin \text{dom}(\tau) \text{ or } \tau(J(\bar{a})) \notin J_\alpha(V_{\lambda+1}),$$

or

2. $\bar{\alpha} \notin \text{rng } \bar{\tau}$.

Such an $\bar{\alpha}$ clearly exists. Set $\pi_J(\bar{\alpha}) = \alpha$. We need to see that this is an appropriate definition in the sense that:

1. $\pi_J(\bar{\alpha})$ is not already defined.

2. For $\bar{\alpha}' < \bar{\alpha}$, $\pi_J(\bar{\alpha}')$ is defined and is less than $\alpha$.

To see 2, suppose that $\bar{\alpha}' < \bar{\alpha}$, and suppose $(\bar{A}', \phi')$ $\tilde{\lambda}$-tags $\bar{\alpha}'$. Then by our definition of $\bar{\alpha}$, it must be the case that there exists $\bar{a}' \in V_{\bar{\lambda}+1}$ such that $\bar{\tau}(\bar{a}') = \bar{\alpha}'$, and $\tau(J(\bar{a}')) \in J_\alpha(V_{\lambda+1})$. 
Suppose that $\beta < \alpha$ is such that $\tau(J(\bar{a})) \in J_\beta(V_{\lambda+1})$. Let $(B, \psi) \lambda$-tag $\beta$, and consider $K \in \mathcal{F}^\infty$ such that for some $i_0 < \omega,$

$$\langle K_{i_0}(A), K_{i_0}(\bar{A}'), K_{i_0}(\bar{a}), K_{i_0}(\bar{a}') \rangle = \langle J_{i_0}(A), J_{i_0}(\bar{A}'), J_{i_0}(\bar{a}), J_{i_0}(\bar{a}') \rangle$$

and $K_{i_0}(\bar{B}) = B$ for some $\bar{B} \in V_{\lambda+1}$. By induction there exists $\bar{\beta}$ such that

$$\bar{K}_{i_0} : J_{\bar{\beta}}(V_{\lambda+1}) \to J_{\bar{\beta}}(V_{\lambda+1})$$

is elementary. And since $J_{i_0}(\bar{a}') = K_{i_0}(\bar{a}')$ and $(\tau)^{J_\beta(V_{\lambda+1})}(K_{i_0}(\bar{a}')) = \tau(J_{i_0}(\bar{a}'))$, we have that $\tau(J_{i_0}(\bar{a}')) \in \operatorname{rng} \bar{K}_{i_0}$. And then by elementaryity we must have that

$$\bar{K}_{i_0}^{-1}(\tau(J_{i_0}(\bar{a}'))) = \bar{K}_{i_0}^{-1}((\tau)^{J_{\bar{\beta}}(V_{\lambda+1})}(K_{i_0}(\bar{a}'))) = (\tau)^{J_{\bar{\beta}}(V_{\lambda+1})}(\bar{a}') = \bar{a}'$$

Hence $\alpha' := \bar{K}_{i_0}(\bar{a}')$ is an ordinal by elementaryity and it is less than $\alpha$. Furthermore by elementaryity, we have that since $(\bar{A}', \phi') \lambda$-tags $\bar{a}'$, that $(K_{i_0}(\bar{A}'), \phi') = (J_{i_0}(\bar{A}'), \phi') \lambda$-tags $\alpha'$. But by induction this implies that $\pi_{i_0}^{-1}(\bar{a}') = \alpha' < \alpha$. Furthermore we have that $\pi_{\bar{\beta}}(\bar{a}') = (j_0 \circ \cdots \circ j_{i_0-1} \circ \pi_{i_0}(\bar{a}')) < \alpha$, since $j_i(\alpha) = \alpha$ for all $i$.

To see 1, if $\pi_{\bar{\beta}}(\bar{a})$ is already defined then $\pi_{\bar{\beta}}(\bar{a}) < \alpha$. Let $\pi_{\bar{\beta}}(\bar{a}) = \alpha' < \alpha$. Then $J : J_{\bar{\beta}+1}(V_{\lambda+1}) \to J_{\alpha'+1}(V_{\lambda+1})$ is elementary by induction. Since $(\tau)^{J_{\bar{\beta}+1}(V_{\lambda+1})}$ is a partial function $V_{\lambda+1} \to J_{\alpha'}(V_{\lambda+1})$ which is a surjection, by elementaryity of $J$, $(\tau)^{J_{\bar{\beta}+1}(V_{\lambda+1})}$ is a partial function $V_{\lambda+1} \to J_{\alpha'}(V_{\lambda+1})$ which is a surjection. But this contradicts the definition of $\alpha$.

Now let $\bar{\alpha}_0$ be least such that there exists $K \in \mathcal{F}^\infty$ such that $K(\bar{A}) = A$ and $\pi_K(\bar{\alpha}_0) = \alpha$. We will show that $(\bar{A}, \phi) \lambda$-tags $\bar{\alpha}_0$. Suppose that we are in case 1 of the definition of $\pi_J(\bar{a})$, and suppose $\pi(\bar{a}) = \bar{\alpha}_0$. The key point is that for any $K' \in \mathcal{F}^\infty$ such that $K'(\bar{A}) = K(\bar{A})$ and $K'(\bar{a}) = K(\bar{a})$, we must have that $\pi_{K'}(\bar{\alpha}_0) = \alpha$. This follows by minimality of $\bar{\alpha}_0$, and the fact that either $\pi(K'(\bar{a})) = \tau(K(\bar{a})) \notin J_\alpha(V_{\lambda+1})$ or $K'(\bar{a}) \notin \operatorname{dom}(\pi)$. And hence for any such $K'$, if $X \subset V_{\lambda+1}$ codes $J_{\alpha_0}(V_{\lambda+1})$ and $X \subset V_{\lambda+1}$ codes $J_\alpha(V_{\lambda+1})$, then

$$K' : (V_{\lambda+1}, X) \to (V_{\lambda+1}, X)$$

is $\Sigma_0$-elementary. But then by Lemma 2.3.6, $(\bar{A}, \phi) \lambda$-tags $\bar{\alpha}_0$, which is what we wanted.

If we are in case 2 of the definition of $\pi_J(\bar{a})$, then we immediately have that $\pi_{K'}(\bar{\alpha}_0) = \pi_K(\bar{\alpha}_0)$ for any $K' \in \mathcal{F}^\infty$ such that $K'(\bar{A}) = K(\bar{A})$, by minimality of $\bar{\alpha}_0$. Then to show that $(\bar{A}, \phi) \lambda$-tags $\bar{\alpha}_0$ is exactly the same is in case 1.

Now since $(\bar{A}, \phi) \lambda$-tags $\bar{\alpha}_0$, and $J(\bar{A}) = A$, if $\pi_J(\bar{a}) = \alpha$ where $\bar{a} > \bar{\alpha}_0$, then $\pi_J(\bar{a}_0)$ is already defined and is less than $\alpha$. But then for $\alpha_0 := \pi_J(\bar{a}_0)$, $\bar{J} : J_{\alpha_0+1}(V_{\lambda+1}) \to J_{\alpha_0+1}(V_{\lambda+1})$ is elementary, and hence $(\bar{A}, \phi) \lambda$-tags $\alpha_0$ by elementaryity. But this is a contradiction since $(\bar{A}, \phi) \lambda$-tags $\alpha > \alpha_0$. Hence $\pi_J(\bar{a}_0) = \alpha$, and the proof above shows that $\pi_J$ extends to $\bar{J} : J_{\alpha_0}(V_{\lambda+1}) \to J_\alpha(V_{\lambda+1})$.

Hence we have shown that the induction hypothesis holds for $\alpha + 1$ for the case of $\alpha$ a limit. For $\alpha$ a successor, the induction hypothesis follows immediately from Lemma 2.3.6. Hence by induction the theorem is proved.\]
We can use a similar technique to push the reflection a bit past $\kappa$:

**Theorem 2.4.2.** Let $\kappa$ be least such that $J_{\kappa}(V_{\lambda+1}) \prec_{\Sigma_1(V_{\lambda+1} \cup \{\lambda+1\})} J_{\kappa+1}(V_{\lambda+1})$. Suppose there exists an elementary embedding $j : J_{\kappa+\omega+1}(V_{\lambda+1}) \rightarrow J_{\kappa+\omega+1}(V_{\lambda+1})$. Then there is $\bar{\lambda} < \lambda$ such that there is an elementary embedding

$$\hat{J} : J_{\bar{\kappa}}(V_{\bar{\lambda}+1}) \rightarrow J_{\kappa}(V_{\bar{\lambda}+1}),$$

where $\bar{\kappa}$ is defined similarly to $\kappa$ for $\bar{\lambda}$ instead of $\lambda$.

**Proof.** Define $\pi$ as in the previous proof. Let $\mathcal{F}^{\kappa+2} \subseteq \mathcal{E}_{\kappa+2}^e$ be saturated. We prove that for every $J \in \mathcal{F}^{\kappa+2}$, if $\bar{\alpha}_J = \sup\{\beta | \pi_J(\beta) \text{ is defined}\}$, then $\bar{\alpha}_J = \bar{\kappa}$. Suppose not, and let $\alpha_0 < \bar{\kappa}$ be least such that there exists $J \in \mathcal{F}^{\kappa+2}$ with $\bar{\alpha}_J = \alpha_0$. Since $\alpha_0 < \bar{\kappa}$, there exists $A \in V_{\bar{\lambda}+1}$ and $\phi$ such that $(A, \phi)$ $\lambda$-tags $\bar{\alpha}_0$. Fix $J$ such that $\bar{\alpha}_J = \alpha_0$.

**Claim 2.4.3.** For all $K \in \mathcal{F}^{\kappa+2}$ such that $K(A) = J(A)$, we have $\bar{\alpha}_K = \alpha_0$.

**Proof.** We must have that there is no $\alpha < \kappa$ such that $(J(A), \phi)$ $\lambda$-tags $\alpha$, since otherwise by the arguments of the previous proof, we would have $\pi_J(\alpha_0) = \alpha$. And hence if $K \in \mathcal{F}^{\kappa+2}$ is such that $K(A) = J(A)$ and $\bar{\alpha}_K > \alpha_0$, then $\alpha_0 := \pi_K(\alpha_0)$ is defined and less than $\kappa$. Furthermore, $\hat{K} : J_{\alpha_0}(V_{\bar{\lambda}+1}) \rightarrow J_{\alpha_0}(V_{\bar{\lambda}+1})$ is elementary, and hence we must have that $(K(A), \phi)$ $\lambda$-tags $\alpha_0 < \kappa$. But $K(A) = J(A)$, which is a contradiction. \[\square\]

So for $X \subseteq V_{\bar{\lambda}+1}$ and $X \subseteq V_{\lambda+1}$ such that $X$ codes $J_{\alpha_0}(V_{\bar{\lambda}+1})$ and $X$ codes $J_{\kappa}(V_{\lambda+1})$, we have that $K : (V_{\bar{\lambda}+1}, X) \rightarrow (V_{\lambda+1}, X)$ is $\Sigma_0$ for any $K \in \mathcal{F}^{\kappa+2}$ such that $K(A) = J(A)$.

But then by Lemma 2.3.6, we have that any such embedding is actually elementary. Hence we have that $\hat{K} : J_{\alpha_0}(V_{\bar{\lambda}+1}) \rightarrow J_{\kappa}(V_{\lambda+1})$ is elementary, for any such $K$, and hence $\hat{K} : J_{\alpha_0+1}(V_{\bar{\lambda}+1}) \rightarrow J_{\kappa+1}(V_{\lambda+1})$ is elementary. But then it must be that $J_{\alpha_0+1}(V_{\bar{\lambda}+1}) \prec_{\Sigma_1(V_{\lambda+1} \cup \{\lambda+1\})} J_{\alpha_0}(V_{\bar{\lambda}+1})$, which is a contradiction to the fact that $\bar{\alpha}_0 < \bar{\kappa}$. Hence we must have that $\bar{\alpha}_J = \bar{\kappa}$ for all $J \in \mathcal{F}^{\kappa+2}$. And arguing as we just did, we have that

$$\hat{J} : J_{\bar{\kappa}}(V_{\bar{\lambda}+1}) \rightarrow J_{\kappa}(V_{\bar{\lambda}+1})$$

is elementary. \[\square\]

**Corollary 2.4.4.** Let $\kappa$ be least such that

$$J_{\kappa}(V_{\lambda+1}) \prec_{\Sigma_1(V_{\lambda+1} \cup \{\lambda+1\})} J_{\kappa+1}(V_{\lambda+1}).$$

Suppose there exists an elementary embedding

$$j : J_{\kappa+\omega+1}(V_{\lambda+1}) \rightarrow J_{\kappa+\omega+1}(V_{\lambda+1}).$$

Then there is $\bar{\lambda} < \lambda$ such that there is an elementary embedding

$$\tilde{j} : J_{\kappa}(V_{\bar{\lambda}+1}) \rightarrow J_{\kappa}(V_{\lambda+1}).$$
Theorem 2.4.5. Let \( \kappa_0 \) be least such that
\[
J_{\kappa_0}(V_{\lambda+1}) \prec_{\Sigma_1(V_{\lambda+1} \cup \{V_{\lambda+1}\})} J_{\kappa_0+1}(V_{\lambda+1}).
\]
Let \( \kappa_1 \) be least such that
\[
J_{\kappa_1}(V_{\lambda+1}) \prec_{\Sigma_1(V_{\lambda+1} \cup \{V_{\lambda+1}, \kappa_0\})} J_{\kappa_1+1}(V_{\lambda+1}).
\]
Suppose there exists an elementary embedding
\[
j : J_{\kappa_1+\omega+1}(V_{\lambda+1}) \rightarrow J_{\kappa_1+\omega+1}(V_{\lambda+1}).
\]
Then there is \( \tilde{\lambda} < \lambda \) and \( \tilde{\kappa}_1 \) such that there is an elementary embedding
\[
\tilde{j} : J_{\tilde{\kappa}_1}(V_{\lambda+1}) \rightarrow J_{\kappa_1}(V_{\lambda+1}).
\]

Proof. The proof is almost exactly the same as the proof of Theorem 2.4.1. \( \qed \)

There are similar reflection results provable by the same method for \( \kappa_n \) defined analogously for \( n < \omega \). The method here appears to break down as the \( \Sigma_1 \)-gaps get larger, however. To get past these larger gaps we need a new method, which we present in the next section.

2.5 Reflecting \( I_0 \)

In this section we prove our main reflection result. First we introduce some terminology which identifies the general form of reflection as obtained by inverse limits. In Section 3 we will find that this form of reflection is even more useful than simply having reflection embeddings.

Definition 2.5.1. We define inverse limit reflection at \( \alpha \) to mean the following: There exists \( \lambda, \tilde{\alpha} < \lambda \) and a saturated set \( E \subseteq \mathcal{E} \) such that for all \( (J, \tilde{J}) \in E \), \( J \) extends to \( \tilde{J} : L_{\tilde{\alpha}}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}) \) which is elementary.

We define strong inverse limit reflection at \( \alpha \) to mean the following: There exists \( \tilde{\lambda}, \tilde{\alpha} < \lambda \) and a saturated set \( E \subseteq \mathcal{E} \) such that for all \( (J, \tilde{J}) \in CL(E) \), \( J \) extends to \( \tilde{J} : L_{\tilde{\alpha}}(V_{\lambda+1}) \rightarrow L_{\alpha}(V_{\lambda+1}) \) which is elementary.

We will also need the notion of inverse limit \( X \)-reflection where \( X \subseteq V_{\lambda+1} \). As before we let
\[
\mathcal{E}(X) = \{(J, \langle j_i | i < \omega \rangle) | \forall i (j_i : (V_{\lambda+1}, X) \rightarrow (V_{\lambda+1}, X)) \text{ and } J = j_0 \circ j_1 \circ \cdots : (V_{\lambda+1}, \tilde{X}) \rightarrow (V_{\lambda+1}, X) \text{ is } \Sigma_0 \}.
\]

Here we let \( \tilde{X} = J^{-1}[X] \). We modify the definition of saturated to \( X \)-saturated, requiring in addition that \( J^{-1}[X] = K^{-1}[X] \).
**Definition 2.5.2.** Suppose \( X \subseteq V_{\lambda+1} \). We define **inverse limit \( X \)-reflection at \( \alpha \)** to mean the following: There exists \( \bar{\lambda}, \bar{\alpha} < \lambda, \bar{X} \subseteq V_{\lambda+1} \) and an \( X \)-saturated set \( E \subseteq \mathcal{E}(X) \) such that for all \( (J, \bar{j}) \in E \), \( J \) extends to \( \bar{J} : L_{\bar{\alpha}}(\bar{X}, V_{\lambda+1}) \rightarrow L_{\alpha}(X, V_{\lambda+1}) \) which is elementary.

We define **strong inverse limit \( X \)-reflection at \( \alpha \)** to mean the following: There exists \( \bar{\lambda}, \bar{\alpha} < \lambda, \bar{X} \subseteq V_{\lambda+1} \) and an \( X \)-saturated set \( E \subseteq \mathcal{E}(X) \) such that for all \( (J, \bar{j}) \in CL(E) \), \( J \) extends to \( \bar{J} : L_{\bar{\alpha}}(\bar{X}, V_{\lambda+1}) \rightarrow L_{\alpha}(X, V_{\lambda+1}) \) which is elementary.

Note that we cannot immediately conclude elementarity of \( J : (V_{\lambda+1}, \bar{X}) \rightarrow (V_{\lambda+1}, X) \) as \( \bar{X} \) depends on \( J \) in general. And in fact we will show that inverse limit \( X \)-reflection does not hold in general.

**Theorem 2.5.3.** Suppose there exists an elementary embedding \( j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1}) \). Then there exists \( \bar{\lambda} < \lambda \) such that for all \( \alpha < \Theta_{\bar{\lambda}} \), there exists \( \bar{\alpha} \) such that

\[
L_{\bar{\alpha}}(V_{\lambda+1}) \equiv L_{\alpha}(V_{\lambda+1}).
\]

*Proof.* Suppose that \( \alpha < \Theta_{\bar{\lambda}} \) is good, \( \rho : V_{\lambda+1} \rightarrow L_{\alpha}(V_{\lambda+1}) \) is a surjection definable over \( L_{\alpha+1}(V_{\lambda+1}) \), with \( X \subseteq V_{\lambda+1} \) the preimage. Let \( G \subseteq \text{Coll}(\omega, \lambda) \) be \( V \)-generic.

Let \( E \subseteq \mathcal{E}_{\alpha+1} \) be saturated and \( (J, \bar{j}) \in E \). Let \( \bar{\lambda} \) be cofinal in \( \bar{\lambda}_J = \bar{\lambda} \). In \( V[G] \), let \( \langle a_i \mid i < \omega \rangle \) be an enumeration of \( V_{\lambda+1} \), and let \( \langle \phi^i \mid i < \omega \rangle \) be an enumeration of all formulas in the language (\( \in \)). We define sequences \( \langle J^i \mid i < \omega \rangle, \langle n_i \mid i < \omega \rangle \) in \( V[G] \) with the following properties:

1. \( J^0 = J \). For all \( i < \omega, J^i \in E \) and \( J^{i+1} \) is a limit root of \( J^i \), supported by \( \bar{\lambda} \).
2. \( \langle n_i \mid i < \omega \rangle \) is increasing, and for all \( i < \omega \), for all \( n \leq n_i, J^{i+1}(a_n) = J^i(a_n) \).
3. For all \( i_0 < \omega \), suppose that \( L_{\alpha}(V_{\lambda+1}) \models \exists x \phi(x, \bar{B}) \) where

\[
\bar{B} = \langle \rho(J^{i_0}(a_{s_1})), \ldots, \rho(J^{i_0}(a_{s_m})) \rangle
\]

and for all \( i < m, s_i \leq i_0 \) and \( \exists x \phi(x, \bar{X}) \) is the formula \( \phi^i \) for some \( i < i_0 \). Then for some \( b \) which is a witness to \( \phi \) with parameter \( \bar{B} \), we have

\[
\rho(J^{i_0+1}(a_{\bar{t}})) = b
\]

and \( n_{i_0+1} \geq \bar{t} \).

Note that we can arrange (3) as follows. Suppose that \( i_0 < \omega \) and

\[
L_{\alpha}(V_{\lambda+1}) \models \exists x \phi(x, \bar{B}),
\]

where

\[
\bar{B} = \langle \rho(J^{i_0}(a_{s_1})), \ldots, \rho(J^{i_0}(a_{s_m})) \rangle.
\]
CHAPTER 2. INVERSE LIMITS

Let \( i \) be such that for all \( A \in V_{\lambda+1} \) and \( B \in V_{\lambda+1} \), there exists \((K, \vec{k}) \in E \), with \( K \) an \( i \)-close limit root of \( J^0 \), \( K_i(A) = J^0_i(A) \) and \( B \in \text{rng} \ K \). Pulling back by \( j_i^0 \circ \cdots \circ j_{i-1}^0 \), we have

\[
L_\alpha(V_{\lambda+1}) \models \exists x \phi(x, \vec{B}_i),
\]

where

\[
\vec{B}_i = \langle \rho(j_i^0(a_{s_1})), \ldots, \rho(j_i^0(a_{s_n})) \rangle.
\]

Let \( b \) be a witness to \( \phi \) with parameter \( \vec{B}_i \). Then if \((K, \vec{k}) \in E \) is an \( i \)-close limit root of \( J^0 \), satisfies (2), and for some \( \bar{t} \), \( \rho(K_i(a_i)) = b \) then

\[
L_\alpha(V_{\lambda+1}) \models \phi(\rho(j_0^0 \circ \cdots \circ j_{i-1}^0)(b), \vec{B}).
\]

To arrange (3), we simply work with the finitely many \( \vec{B} \) and \( \phi \) required by (3) simultaneously.

Let \( J^* \) be the common part of \( \langle J^i | i < \omega \rangle \). Then by (2) and Lemma 2.1.16 we have that \( J^* : V_{\lambda+1} \rightarrow V_{\lambda+1} \) since for all \( a \in V_{\lambda+1} \), there is an \( n \) such that \( a_n = a \). And hence for \( i \) large enough, we have that \( J^*(a_n) = J^i(a_n) \in V_{\lambda+1} \).

Let \( M = \rho[J^*[V_{\lambda+1}]] \). We claim that \( M \prec L_\alpha(V_{\lambda+1}) \). But this follows immediately from condition (3). Furthermore, \( M \) is wellfounded. Let \( \overline{M} \) be the transitive collapse of \( M \) and let \( \pi \) be the inverse of the transitive collapse. We have that \( V_{\lambda+1} = \pi^{-1}[V_{\lambda+1}] \), and hence by condensation, we have that \( \overline{M} = L_\alpha(V_{\lambda+1}) \) for some \( \overline{\alpha} \). So \( L_\alpha(V_{\lambda+1}) \equiv L_\alpha(V_{\lambda+1}) \). But, by absoluteness, in \( V \) we have that \( L_{\overline{\alpha}}(V_{\lambda+1}) \equiv L_\alpha(V_{\lambda+1}) \), which is what we wanted. \( \square \)

Based on the proof of Theorem 2.5.3, we fix some terminology which will be useful in the following theorems.

**Definition 2.5.4.** Fix \( E \subseteq \mathcal{E} \) saturated, \( \alpha \) good, and \( J \in E \). Set \( \bar{\lambda} = \bar{\lambda}_J \) and let \( \bar{\lambda} \) be cofinal in \( \bar{\lambda} \). Fix \( \langle \phi^i | i < \omega \rangle \), an enumeration of all formulas in the language \( (\in) \). We define a forcing \( \mathbb{P}(E, \alpha, J) \). Conditions are elements \( \langle \langle J^i, n_i | i < m \rangle, \langle a_i | i < n_{m-1} \rangle \rangle \) where \( m \geq 1 \) and the following hold.

1. \( J^0 = J \). For all \( i < m - 1 \), \( J^{i+1} \) is a limit root of \( J^i \) supported by \( \bar{\lambda}_i \), and \( J^{i+1} \in E \).

2. \( \langle n_i | i < m \rangle \in \omega^m \) is an increasing sequence.

3. For all \( i < n_{m-1} \), \( a_i \in V_{\bar{\lambda}_J+1} \).

4. For all \( 1 \leq m' < m \), and \( i < n_{m'-1} \), \( J^{m'-1}(a_i) = J^{m'}(a_i) \).

5. For all \( m' < m - 1 \), suppose that \( L_\alpha(V_{\lambda+1}) \models \exists x \phi(x, \vec{B}) \) where

\[
\vec{B} = \langle \rho(J^{m'}(a_{s_1})), \ldots, \rho(J^{m'}(a_{s_n})) \rangle
\]
and for all \( i < n \), \( s_i \leq m' \) and \( \exists x \phi(x, \vec{X}) \) is the formula \( \phi^i \) for some \( i < m' \). Then for some \( b \) which is a witness to \( \phi \) with parameter \( \vec{B} \), we have
\[
\rho(J^{m'+1}(a_t)) = b
\]
for some \( \bar{t} < n_{m'+1} \).

For \((\langle J^i, n_i \mid i < m \rangle, \langle a_i \mid i < n_{m-1} \rangle)\) \((\langle K^i, n'_i \mid i < m' \rangle, \langle a'_i \mid i < n'_{m'-1} \rangle)\) \(\in \mathbb{P}(E, \alpha, J)\) we put
\[
(\langle J^i, n_i \mid i < m \rangle, \langle a_i \mid i < n_{m-1} \rangle) \geq_{\mathbb{P}(E, \alpha, J)} (\langle K^i, n'_i \mid i < m' \rangle, \langle a'_i \mid i < n'_{m'-1} \rangle)
\]
iff
1. \( m \leq m' \),
2. for all \( i < m \), \( J^i = K^i \), \( n_i \leq n'_i \), and for all \( s < n_{m-1} \), \( a_s = a'_s \).

Suppose that \( g \subseteq \mathbb{P}(E, \alpha, J) \) is \( L(V_{\lambda+1}) \)-generic. Then clearly in \( L(V_{\lambda+1})[g] \) we obtain a unique sequence \( \langle J^i \mid i < \omega \rangle \) from \( g \) such that for all \( i \), \( J^{i+1} \) is a limit root of \( J^i \). We set \( J^g \) to be the common part of \( \langle J^i \mid i < \omega \rangle \).

**Lemma 2.5.5.** Assume we are in the situation of Definition 2.5.4. Suppose that
\[
g \subseteq \mathbb{P}(E, \alpha, J)
\]
is \( L(V_{\lambda+1}) \)-generic. Then \( J^g \) maps \( V_{\lambda+1} \rightarrow V_{\lambda+1} \), and there exists an \( \bar{\alpha} \) such that \( J^g \) extends to an elementary embedding
\[
\bar{J}^g : J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_{\alpha}(V_{\lambda+1}).
\]

**Proof.** This follows exactly as in the proof of Theorem 2.5.3. \( \square \)

**Lemma 2.5.6.** Assume we are in the situation of Definition 2.5.4. Suppose that
\[
(\langle J^i, n_i \mid i < m \rangle, \langle a_i \mid i < n_{m-1} \rangle) \in \mathbb{P}(E, \alpha, J)
\]
and there exists \( \bar{\alpha} \) such that
\[
(\langle J^i, n_i \mid i < m \rangle, \langle a_i \mid i < n_{m-1} \rangle) \models J^g : J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_{\alpha}(V_{\lambda+1}) \text{ is elementary.}
\]
Then \( J^{m-1} \) extends to an elementary embedding \( J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_{\alpha}(V_{\lambda+1}) \).

**Proof.** We assume for simplicity of notation that \( m = 1 \). So we have
\[
p := (\langle J, n_0 \rangle, \langle a_i \mid i < n_0 \rangle) \in \mathbb{P}(E, \alpha, J)
\]
and there exists $\bar{\alpha}$ such that

$$(\langle J, n_0 \rangle, \langle a_i | i < n_0 \rangle) \models J^\beta : J_\alpha(V_{\lambda+1}) \rightarrow J_\alpha(V_{\lambda+1})$$

is elementary.

We extend $J$ to a map $\hat{J}$ as follows. Suppose that $\bar{B} \in V_{\lambda+1}$, $B \in V_{\lambda+1}$, $\bar{b} \in J_\alpha(V_{\lambda+1})$, $b \in J_\alpha(V_{\lambda+1})$, and $\phi$ are such that $J(\bar{B}) = B$, and $b$ is the unique element of $J_\alpha(V_{\lambda+1})$ such that $J_\alpha(V_{\lambda+1}) \models \phi(b, B)$ and $\bar{b}$ is the unique element of $J_\alpha(V_{\lambda+1})$ such that $J_\alpha(V_{\lambda+1}) \models \phi(\bar{b}, B)$. Then set $\hat{J}(\bar{b}) = b$.

We need to check that $\hat{J} : J_\alpha(V_{\lambda+1}) \rightarrow J_\alpha(V_{\lambda+1})$ is well-defined, total, and elementary. The proofs of each of these facts are very similar. First we check that $\hat{J}$ is well-defined. Suppose that $\bar{B}_1, B_1, \phi_1$ witness that $\hat{J}(\bar{b}) = b_1$ and $\bar{B}_2, B_2, \phi_2$ witness that $\hat{J}(\bar{b}) = b_2$. Let $p' \leq_{P(E, \alpha, J)} p$ be the condition

$$p' = (\langle J, n_0 + 2 \rangle, \langle a_i | i < n_0 \rangle \setminus \langle \bar{B}_1, \bar{B}_2 \rangle).$$

Then

$$p' \models J^\beta(\bar{B}_1) = B_1 \land J^\beta(\bar{B}_2) = B_2,$$

and hence

$$p' \models b_1 = \hat{J}(\bar{b}) = b_2.$$ 

So $b_1 = b_2$ by absoluteness, which is what we wanted.

Now we check that $\hat{J}$ is total. We first show that $\bar{\alpha}$ is $(\bar{\lambda})$-good. Let $\bar{b} \in J_\alpha(V_{\lambda+1})$. Suppose $p \in g \subseteq P(E, \alpha, J)$ is $L(V_{\lambda+1})$-generic and $\hat{J}(\bar{b}) = b \in J_\alpha(V_{\lambda+1})$. Then since $\alpha$ is good there exists a $B \in V_{\lambda+1}$ such that $J_\alpha(V_{\lambda+1}) \models b$ is the unique element such that $\phi(b, B)$. Hence

$$J_\alpha(V_{\lambda+1}) \models \exists B' \in V_{\lambda+1}(b \text{ is the unique element such that } \phi(b, B')).$$

But then by elementarity of $J^\beta$,

$$J_\alpha(V_{\lambda+1}) \models \exists B' \in V_{\lambda+1}(b \text{ is the unique element such that } \phi(\bar{b}, \bar{B}')).$$

So this shows that $\bar{\alpha}$ is good.

To see that $\hat{J}$ is total, let $\bar{b} \in J_\alpha(V_{\lambda+1})$ and let $\bar{B}$ and $\phi$ be such that $J_\alpha(V_{\lambda+1}) \models \bar{b}$ is the unique element such that $\phi(\bar{b}, \bar{B})$. Set $B = J(\bar{B})$. Let $p' \leq_{P(E, \alpha, J)} p$ be the condition

$$p' = (\langle J, n_0 + 1 \rangle, \langle a_i | i < n_0 \rangle \setminus \langle \bar{B} \rangle).$$

Then

$$p' \models J^\beta(\bar{B}) = B,$$

and hence

$$p' \models J_\alpha(V_{\lambda+1}) \models J^\beta(\bar{b}) \text{ is the unique element such that } \phi(J^\beta(\bar{b}), B).$$
Let \( p'' \leq_{\mathcal{P}(E, \alpha, J)} p' \) be such that for some \( b \in J_\alpha(V_{\lambda+1}) \), \( p'' \models J^{\hat{g}}(b) = b \). But then by absoluteness we have that
\[
J_\alpha(V_{\lambda+1}) \models b \text{ is the unique element such that } \phi(b, B).
\]
So we must have that \( \hat{J}(b) = b \).

To see that \( \hat{J} \) is elementary, suppose that \( b \in J_\alpha(V_{\lambda+1}) \) and \( \psi \) is a formula. Let \( \bar{B} \) and \( \phi \) be such that \( J_\alpha(V_{\lambda+1}) \models \bar{b} \) is the unique element such that \( \phi(\bar{b}, B) \). Set \( b = \hat{J}(\bar{b}) \) and \( B = J(\bar{B}) \). Let \( p' \leq_{\mathcal{P}(E, \alpha, J)} p \) be the condition
\[
p' = (\langle \bar{J}, n_0 + 1 \rangle, \langle a_i | i < n_0 \rangle, \langle \bar{B} \rangle).
\]
Then
\[
p' \models J^{\hat{g}}(\bar{B}) = B \land \hat{J}^{\hat{g}}(\bar{b}) = b,
\]
and hence
\[
p' \models J_\alpha(V_{\lambda+1}) \models \psi(\bar{b}) \iff J_\alpha(V_{\lambda+1}) \models \psi(b).
\]
But by absoluteness \( J_\alpha(V_{\lambda+1}) \models \psi(\bar{b}) \iff J_\alpha(V_{\lambda+1}) \models \psi(b) \), which is what we wanted.

So \( \hat{J} : J_\alpha(V_{\lambda+1}) \to J_\alpha(V_{\lambda+1}) \) is an elementary embedding, as desired.

**Theorem 2.5.7.** Suppose that there exists an elementary embedding \( j : L(V_{\lambda+1}) \to L(V_{\lambda+1}) \). Then inverse limit reflection holds at \( \alpha \) for all \( \alpha < \Theta \).

**Proof.** It is enough to show that for all \( \alpha < \Theta \) good, inverse limit reflection holds at \( \alpha \), since if inverse limit reflection holds at \( \alpha \) good then it holds at all \( \beta \leq \alpha \). So assume that \( \alpha < \Theta \) is good. Since there exists an elementary embedding \( j : L(V_{\lambda+1}) \to L(V_{\lambda+1}) \), there must exist a saturated set \( E \subseteq \mathcal{E}_\alpha \). Fix \( J \in E \).

Let
\[
p = (\langle \bar{J}, n_i | i < m \rangle, \langle a_i | i < n_{m-1} \rangle) \in \mathcal{P}(E, \alpha, J)
\]
be a condition such that for some \( \bar{\alpha} \)
\[
p \models J^{\hat{g}} : J_\bar{\alpha}(V_{\lambda+1}) \to J_\alpha(V_{\lambda+1}) \text{ is elementary.}
\]
Then we have that \( J^{m-1} \) extends to an elementary embedding \( J_\bar{\alpha}(V_{\lambda+1}) \to J_\alpha(V_{\lambda+1}) \). Let \( E_p \) be the set of inverse limits \( K \in E \) such that for some \( q \leq_{\mathcal{P}(E, \alpha, J)} p \) if
\[
q = (\langle K^i, n'_i | i < m' \rangle, \langle a'_i | i < n_{m'-1} \rangle)
\]
then \( K = K^{m'-1} \).

Clearly by definition of \( \mathcal{P}(E, \alpha, J) \) we have that \( E_p \) is saturated as well. Furthermore by Lemma 2.5.6 we have that for all \( K \in E_p \) that \( K \) extends to an elementary embedding
\[
\hat{K} : J_\bar{\alpha}(V_{\lambda+1}) \to J_\alpha(V_{\lambda+1}).
\]
Hence inverse limit reflection holds at \( \alpha \).
In Section 2.6 we will show, using a more detailed analysis, that strong inverse limit reflection holds all the way up to $\Theta$. The following theorem, which shows that it holds up to the least stable of $L(V_{\lambda+1})$, follows from the same type of argument as above, however.

**Theorem 2.5.8.** Suppose that there exists an elementary embedding $j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$. Let $\delta$ be least such that $$J_{\delta}(V_{\lambda+1}) \prec_{\Sigma_i(V_{\lambda+1} \cup (V_{\lambda+1}))} L(V_{\lambda+1}).$$ Then strong inverse limit reflection holds at $\alpha$ for all $\alpha < \delta$.

**Proof.** Suppose $\alpha < \delta$, $A \in V_{\lambda+1}$ and $(A, \phi)$ is a tag for $\alpha$ (such $\alpha$ are cofinal in $\delta$). Let $E \subseteq \mathcal{E}_{\alpha+1}$ be a saturated set of inverse limits such that for some $\bar{A} \in V_{\lambda+1}$, for all $(J, j) \in E$, $J(\bar{A}) = A$.

Let $J \in E$. We claim that for some $\bar{\alpha}$, $$\emptyset \not\models_{\mathcal{P}(E, \alpha+1, J)} J^{\bar{\alpha}} : J_{\alpha+1}(V_{\lambda+1}) \rightarrow J_{\alpha+1}(V_{\lambda+1})$$ is elementary.

But this is clear since $$\emptyset \not\models_{\mathcal{P}(E, \alpha+1, J)} \exists \bar{\alpha}' (J^{\bar{\alpha}'} : J_{\alpha'+1}(V_{\lambda+1}) \rightarrow J_{\alpha+1}(V_{\lambda+1})$$ is elementary $\land J^{\bar{\alpha}}(\bar{A}) = A \land (\bar{A}, \phi)$ tags $\bar{\alpha}'$.

And hence by absoluteness there is an $\bar{\alpha}$ which is tagged by $(\bar{A}, \phi)$, and this $\bar{\alpha}$ is as desired.

Hence we have by Lemma 2.5.6 that for all $K \in E$, that $K$ extends to an elementary embedding $\tilde{K} : J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_{\alpha}(V_{\lambda+1})$.

We also have that for any $K \in \mathcal{E}_{\alpha+\omega}$ such that $K(\bar{A}) = A$ that there exists a saturated set $E_K \subseteq \mathcal{E}_{\alpha+1}$ such that $K \in E_K$ and for all $K' \in E_K$, $K'(\bar{A}) = A$. Hence this shows that for any $K \in \mathcal{E}_{\alpha+\omega}$ such that $K(\bar{A}) = A$ that $K$ extends to an elementary embedding $\tilde{K} : J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_{\alpha}(V_{\lambda+1})$.

To complete the proof we consider a saturated set $E \subseteq \mathcal{E}_{\alpha+\omega}$ such that for all $J \in E$, $J(\bar{A}) = A$ for some $(A, \phi)$ a tag for $\alpha$. Such an $E$ must exist since there exists an elementary embedding $j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$. Let $\bar{\alpha}$ be as above. Then for all $K \in CL(E)$ we have that $K(\bar{A}) = A$ and $K \in \mathcal{E}_{\alpha+\omega}$. Hence by what we proved above we have that $K$ extends to an elementary embedding $\tilde{K} : J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_{\alpha}(V_{\lambda+1})$. Hence this $E$ witnesses strong inverse limit reflection at $\alpha$.

**Theorem 2.5.9.** Suppose that there exists an elementary embedding $$j : L_{\omega_{2+1}}(V^\#_{\lambda+1}, V_{\lambda+1}) \rightarrow L_{\omega_{2+1}}(V^\#_{\lambda+1}, V_{\lambda+1})$$ Then there exists $\bar{\lambda} < \lambda$ and a $V^\#_{\lambda+1}$-saturated set $E \subseteq \mathcal{E}(V^\#_{\lambda+1})$ of inverse limits such that for all $(J, j) \in E$, $J$ is an elementary embedding $$J : (V^\#_{\lambda+1}, V_{\lambda+1}) \rightarrow (V^\#_{\lambda+1}, V_{\lambda+1}).$$ And hence there exists an elementary embedding $\tilde{j} : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$. Furthermore strong inverse limit $V^\#_{\lambda+1}$-reflection holds at $0$. 

\qed
Proof. We describe how to modify the proof of Theorem 2.5.3. Let $E \subseteq \mathcal{E}(V_{\lambda+1}^\#)$ be saturated (but not necessarily $V_{\lambda+1}^\#$-saturated). Then proceeding exactly as in the proof of Theorem 2.5.3, replacing $L_\alpha(V_{\lambda+1})$ with $(V_{\lambda+1}^\#, V_{\lambda+1})$, the argument is exactly the same until the point that we defined $M$.

Let $M = J[V_{\lambda+1}]$. Then $M \prec V_{\lambda+1}$ and for $\bar{M}$ the transitive collapse of $M$ we have $\bar{M} = V_{\lambda+1}$. Let $\pi$ be the inverse of the transitive collapse. Let $\bar{X} = \pi^{-1}[V_{\lambda+1}^\#]$. Then we have that $\bar{X} = V_{\lambda+1}^\#$. So we have that $(V_{\lambda+1}^\#, V_{\lambda+1}) \equiv (V_{\lambda+1}^\#, V_{\lambda+1})$. But by absoluteness this is true in $V$.

The rest of the proof proceeds exactly as in the proof of Theorem 2.5.8.

To see that there is an elementary embedding $L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$, we have that $(V_{\lambda+1}, V_{\lambda+1}^\#)$ satisfies that there is a $\Sigma_1$-elementary embedding $(V_{\lambda+1}, V_{\lambda+1}^\#) \rightarrow (V_{\lambda+1}, V_{\lambda+1}^\#)$. And hence $(V_{\lambda+1}, V_{\lambda+1}^\#)$ satisfies that there is a $\Sigma_1$-elementary embedding $\bar{j} : (V_{\lambda+1}, V_{\lambda+1}^\#) \rightarrow (V_{\lambda+1}, V_{\lambda+1}^\#)$.

So $\bar{j} \upharpoonright V_{\lambda+1}$ extends to an elementary embedding $\bar{j}^* : L_\emptyset(V_{\lambda+1}) \rightarrow L_\emptyset(V_{\lambda+1})$.

Here we are using that every subset of $V_{\lambda+1}$ in $L(V_{\lambda+1})$ is $\Sigma_1$-definable over $(V_{\lambda+1}, V_{\lambda+1}^\#)$ with parameters in $V_{\lambda+1}$. But as in [Woo11] we can define the following ultrafilter $U_j$ from $\bar{j}$,

$X \in U_j \iff \bar{j} \upharpoonright V_{\lambda+1} \in \bar{j}^*(X)$. 

Taking the ultrapower by $U_j$ yields an elementary embedding $L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$ which extends $\bar{j} \upharpoonright V_{\lambda+1}$ (see [Woo11]).

Theorem 2.5.9 gives an example of an $X \subseteq V_{\lambda+1}$ such that inverse limit $X$-reflection holds. The set of such $X$ is very restricted however, as inverse limit $X$-reflection gives structural properties of $L(X, V_{\lambda+1})$. Specifically, we will prove the following theorem in Section 3.1.

**Theorem 2.5.10.** Suppose $X \subseteq V_{\lambda+1}$ and strong inverse limit $X$-reflection holds at $\alpha$. Then there are no disjoint stationary subsets $S_1$ and $S_2$ of $\{\beta < \lambda^+| \text{cof}(\beta) = \omega\}$ such that $S_1, S_2 \in L_\alpha(X, V_{\lambda+1})$. 

Corollary 2.5.11. Assume there exists an elementary embedding
\[ j : L(V_{\lambda+1}) \to L(V_{\lambda+1}). \]
Suppose that \( G \subseteq \text{Coll}(\omega, \omega_1) \) is \( V \)-generic. Then in \( V[G] \), (strong) inverse limit \( V_{\lambda+1} \)-reflection at 1 does not hold.

Proof. We work with \( (H(\lambda^+), V_{\lambda+1}) \) for ease of notation. We have that for
\[ S_1 = \{ \alpha < \lambda^+ | (\text{cof}(\alpha) = \omega)^{L(V_{\lambda+1})} \} \text{ and } S_2 = \{ \alpha < \lambda^+ | (\text{cof}(\alpha) = \omega_1)^{L(V_{\lambda+1})} \}, \]
that \( S_1 \) and \( S_2 \) are definable over \( (H(\lambda^+)^{V[G]}, V_{\lambda+1}) \). Furthermore, \( S_1 \) and \( S_2 \) are stationary in \( V[G] \). And since
\[ S_1, S_2 \in L_1(H(\lambda^+)^{V[G]}, V_{\lambda+1}), \]
we have that inverse limit \( V_{\lambda+1} \)-reflection at 1 does not hold by Theorem 2.5.10. \( \square \)

2.6 Strong inverse limit reflection

In this section we show that strong inverse limit reflection holds all the way up to \( \Theta \). If the reader is tired of reflection at this point, this section can be skipped, as it is only used to weaken the large cardinal assumptions of Corollary 3.1.9. We do however develop the theory of inverse limits significantly further to show, for instance, that inverse limit roots display the pointwise non-decreasing property of their embeddings.

We first show that if an inverse limit has a limit root which extends to an elementary embedding, then it extends as well and in fact factors through its limit root, in some sense.

Lemma 2.6.1. Suppose \( \alpha < \Theta \) is good and that \( K \in E_\alpha, J \in E_{\alpha+1} \) and \( K \) is a limit root of \( J \). Suppose that \( K \) extends to an elementary embedding
\[ \hat{K} : J_\alpha(V_{\lambda+1}) \to J_\alpha(V_{\lambda+1}) \]
and that for \( \langle \bar{\alpha}_n | n < \omega \rangle \) defined by \( \bar{\alpha}_n = (k_0 \circ \cdots \circ k_{n-1})(\bar{\alpha}) \) we have for some \( n < \omega \) that \( \text{crit}(K_{n}^{(n-1)}) > \lambda \) and \( \bar{\alpha}_n \in \text{rng}(j_0 \circ \cdots \circ j_{n-1}) \). Then for some \( \bar{\beta} \geq \bar{\alpha} \), \( J \) extends to an elementary embedding
\[ \hat{J} : J_{\bar{\beta}}(V_{\lambda+1}) \to J_{\alpha}(V_{\lambda+1}). \]

Proof. Define \( M^\alpha_f \subseteq J_\alpha(V_{\lambda+1}) \) as
\[ M^\alpha_f = \{ a \in J_\alpha(V_{\lambda+1}) | \exists A \in V_{\lambda+1} (a \text{ is definable from } A \text{ over } J_\alpha(V_{\lambda+1}) \text{ and } A \in \text{rng } J) \}. \]
Then \( M^\alpha_f \) is wellfounded, satisfies \( ZF^- \) – Replacement since \( J_\alpha(V_{\lambda+1}) \) has these properties and \( M^\alpha_f \) is closed under definability over \( J_\alpha(V_{\lambda+1}) \).
Similarly define \( M^\alpha_K \). Note that \( M^\alpha_K = \hat{K}[J_\alpha(V_{\lambda+1})] \), and hence \( \hat{K} \) is just the inverse of the transitive collapse of \( M^\alpha_K \). Also define \( M^\alpha_{K_n(n^{-1})} \) in the same way and let \( \alpha_n, \hat{\lambda}_n \), and \( \hat{K}^\alpha_{n(n^{-1})} \) be such that for all \( n < \omega \), \( J_{\alpha_n}(V_{\hat{\lambda}_n+1}) \) is the transitive collapse of \( M^\alpha_{K_n(n^{-1})} \) and \( \hat{K}^\alpha_{n(n^{-1})} \) is the inverse of the collapse.

Let \( n < \omega \) be such that \( \text{crit}(K^\alpha_{n(n^{-1})}) > \hat{\lambda} \) and \( \alpha_n \in \text{rng}(\bar{\lambda}_n \circ \cdots \circ j_{n-1}) \). Set \( \bar{\beta} = (\bar{\lambda}_n \circ \cdots \circ j_{n-1})^{-1}(\alpha_n) \). Then we have that for all \( \bar{A} \in V_{\lambda+1} \),

\[
K^\alpha_{n(n^{-1})}(\bar{J}_{n-1}(\bar{A})) = J_{n(n^{-1})}(\bar{J}_{n-1}(\bar{A})).
\]

Hence we must have \( M^\alpha_{n} \subseteq M^\alpha_{K_n(n^{-1})} \).

Furthermore we claim that

\[
M^\alpha_{n} = (\hat{K}^\alpha_{n(n^{-1})} \circ j_0 \circ j_1 \circ \cdots \circ j_{n-1})[J_\beta(V_{\lambda+1})].
\]

To see this, suppose that \( a \in M^\alpha_{n} \) and that \( A \in V_{\lambda+1} \cap \text{rng} J \) is such that \( a \) is definable over \( J_\alpha(V_{\lambda+1}) \) from \( A \) by some formula \( \phi \). Let \( \bar{A} \in V_{\lambda+1} \) be such that \( J(\bar{A}) = A \), and set \( \bar{A}_n = (j_0 \circ \cdots \circ j_{n-1})(\bar{A}) \). Then we have that

\[
K^\alpha_{n(n^{-1})}(\bar{A}_n) = J_{n(n^{-1})}(\bar{A}_n) = A.
\]

Hence by elementarity of \( \hat{K}^\alpha_{n(n^{-1})} \) we have that there is \( \bar{a}_n \in J_{\alpha_n}(V_{\lambda_n+1}) \) such that \( \bar{a}_n \) is defined by \( \phi \) over \( J_{\alpha_n}(V_{\lambda_n+1}) \) with parameter \( \bar{A}_n \). But then by elementarity of \( j_0 \circ \cdots \circ j_{n-1} \) we have that there is \( \bar{a} \in J_{\alpha}(V_{\lambda+1}) \) such that \( \bar{a} \) is defined by \( \phi \) over \( J_{\alpha}(V_{\lambda+1}) \) with parameter \( \bar{A} \). And hence we have that

\[
(\hat{K}^\alpha_{n(n^{-1})} \circ j_0 \circ \cdots \circ j_{n-1})(\bar{a}) = a.
\]

And since \( a \) was arbitrary we have the claim.

Hence, putting everything together, we have that

\[
\hat{K}^\alpha_{n(n^{-1})} \circ j_0 \circ j_1 \circ \cdots \circ j_{n-1} : J_\beta(V_{\lambda+1}) \rightarrow J_\alpha(V_{\lambda+1})
\]

is the desired extension of \( J \).

The previous lemma required that some \( \bar{\alpha}_n \) be in the range of the fragments of \( J \). The next lemma shows that we can always find such a \( K \) where this occurs.

**Lemma 2.6.2.** Suppose \( \alpha < \Theta \) is good and \( J \in \mathcal{E}_{\alpha+1} \). Suppose further that there is a \( K \in \mathcal{E}_\alpha \), a limit root of \( J \) such that for some \( \bar{\alpha} \), \( K \) extends to an elementary embedding

\[
\hat{K} : J_{\bar{\alpha}}(V_{\lambda+1}) \rightarrow J_\alpha(V_{\lambda+1}).
\]

Then there is a \( K \in \mathcal{E}_\alpha \) a limit root of \( J \) such that for some \( n < \omega \) we have \( \text{crit}(K^\alpha_{n(n^{-1})}) > \hat{\lambda}_J \), \( K^\alpha_{n(n^{-1})} \) extends to an elementary embedding

\[
\hat{K}^\alpha_{n(n^{-1})} : J_{\bar{\alpha}}(V_{\lambda_n+1}) \rightarrow J_\alpha(V_{\lambda+1})
\]

for some \( \bar{\alpha} \) and \( \bar{\alpha} \in \text{rng}(j_0 \circ \cdots \circ j_{n-1}) \).
Proof. Fix $\delta < \lambda$ such that $\delta > \bar{\lambda}_J$ and $\delta \in \text{rng} J$ and fix $n$ such that $\text{crit}(J_{n-1}^{(n-1)}) > \delta$. Let $\bar{\alpha}$ be least such that there is $K^n \in \mathcal{E}_{\alpha}$ a $0$-close limit root of $J_{n-1}^{(n-1)}$ such that $\text{crit}(K^n) > \delta$ and $K^n$ extends to an elementary embedding 
\[ \hat{K}^n : J_{\bar{\alpha}}(V_{\bar{\lambda}+1}) \rightarrow J_{\alpha}(V_{\lambda+1}). \]

Then since $J \in \mathcal{E}_{\alpha+1}$ and 
\[ J_{n-1}^{(n-1)}, \bar{\lambda}_n, \delta \in \text{rng}(j_0 \circ \cdots \circ j_{n-1}) \]
we have that $\bar{\alpha} \in \text{rng}(j_0 \circ \cdots \circ j_{n-1})$. Now let $k_0, \ldots, k_{n-1}$ be square roots of $j_0, \ldots, j_{n-1}$ such that for some $\hat{K}^n$, 
\[ (k_0 \circ \cdots \circ k_{n-1})(\hat{K}^n) = K^n \]
and for $K = k_0 \circ \cdots \circ k_{n-1} \circ \hat{K}^n \in \mathcal{E}_{\alpha}$, $K$ is a limit root of $J$, and 
\[ (k_0 \circ \cdots \circ k_{n-1})(\bar{\alpha}) = (j_0 \circ \cdots \circ j_{n-1})(\bar{\alpha}). \]

Then clearly we have $\hat{K}^{(n-1)} = K^n$ and hence $K$ is a witness to the lemma. \qed

Putting the previous two lemmas together, we obtain that a very large collection of inverse limits extend to elementary embeddings.

**Lemma 2.6.3.** Suppose $\alpha < \Theta$ is good and $J \in \mathcal{E}_{\alpha+1}$. Also assume that there is a saturated set $E \subseteq \mathcal{E}_{\alpha+1}$ such that $J \in E$. Then for some $\bar{\alpha}$, $J$ extends to an elementary embedding 
\[ \hat{J} : J_{\bar{\alpha}}(V_{\bar{\lambda}+1}) \rightarrow J_{\alpha}(V_{\lambda+1}). \]

Proof. Let $J$ be as in the hypothesis. Then by the proof of Theorem 2.5.7 there is a sequence $\langle K^n | n < \omega \rangle$ such that the following hold:

1. $K^0 = J$ and for all $n < \omega$, $K^n \in \mathcal{E}_{\alpha+1}$,
2. for all $n < \omega$, $K^{n+1}$ is a limit root of $K^n$,
3. there is a $\bar{\beta}$ and an $n_0$ such that for all $n \geq n_0$ $K^n$ extends to an elementary embedding 
\[ \hat{K}^n : J_{\bar{\beta}}(V_{\bar{\lambda}+1}) \rightarrow J_{\alpha}(V_{\lambda+1}). \]

By applying the previous two lemmas we have that there must be some $\bar{\alpha}_{n-1}$ such that $K^{n-1}$ extends to an elementary embedding 
\[ \hat{K}^{n-1} : J_{\bar{\alpha}_{n-1}}(V_{\bar{\lambda}+1}) \rightarrow J_{\alpha}(V_{\lambda+1}). \]
And similarly by induction we have that there are $\bar{\alpha}_{n-1}, \ldots, \bar{\alpha}_0$ such that for all $i < n$, $K^i$ extends to an elementary embedding 
\[ \hat{K}^i : J_{\bar{\alpha}_i}(V_{\bar{\lambda}+1}) \rightarrow J_{\alpha}(V_{\lambda+1}). \]
So considering $i = 0$ the lemma follows. \qed
We now show that if $J$ extends to $\alpha + 1$ for $\alpha$ good, then the extension is in some sense unique.

**Lemma 2.6.4.** Suppose $\alpha < \Theta$ is good, that $J \in E_{\alpha + 1}$ and $J$ extends to an elementary embedding 
\[ \hat{J} : J_{\bar{\alpha} + 1}(V_{\bar{\lambda} + 1}) \rightarrow J_{\alpha + 1}(V_{\lambda + 1}) \]
for some $\bar{\alpha}$. Then for all $\beta \geq \alpha + 1$, if $J$ extends to an elementary embedding 
\[ \hat{J}^* : J_{\bar{\beta}}(V_{\bar{\lambda} + 1}) \rightarrow J_{\beta}(V_{\lambda + 1}) \]
with $\alpha \in \text{rng} \hat{J}^*$, then $(\hat{J}^*)^{-1}(\alpha) = \bar{\alpha}$ and in fact 
\[ \hat{J}^* \upharpoonright J_{\alpha + 1}(V_{\lambda + 1}) = \hat{J}. \]

**Proof.** The main point is that $\bar{\alpha}$ is $\bar{\lambda}_J$-good. And hence we claim that 
\[ \text{rng} \hat{J} = M^J_{\bar{\alpha}} = \text{rng} (\hat{J}^*) \cap J_\alpha(V_{\lambda + 1}), \]
where $M^J_{\bar{\alpha}}$ is defined as in the proof of Lemma 2.6.1.

To see the first equality, suppose that $a \in \text{rng} \hat{J}$. Let $\bar{a} \in J_{\bar{\alpha}}(V_{\bar{\lambda} + 1})$ be such that $\hat{J}(\bar{a}) = a$ and let $\bar{A}$ and $\phi$ be such that $\bar{a}$ is defined by $\phi$ with parameter $\bar{A}$ over $J_{\bar{\alpha}}(V_{\bar{\lambda} + 1})$. Let $\bar{A} = J(\bar{A})$. By elementarity we have that $a$ is defined by $\phi$ with parameter $A$ over $J_\alpha(V_{\lambda + 1})$. Hence $a \in M^J_{\bar{\alpha}}$.

Now suppose that $a \in M^J_{\bar{\alpha}}$ and let $A = J(\bar{A})$ and $\phi$ be such that $a$ is defined by $\phi$ with parameter $A$ over $J_\alpha(V_{\lambda + 1})$. Then by elementarity, there is $\tilde{a} \in J_{\tilde{\alpha}}(V_{\tilde{\lambda} + 1})$ such that $\tilde{a}$ is defined by $\phi$ with parameter $\tilde{A}$ over $J_{\tilde{\alpha}}(V_{\tilde{\lambda} + 1})$. And hence by elementarity $\hat{J}(\tilde{a}) = a$.

So we have that $\text{rng} \hat{J} = M^J_{\bar{\alpha}}$. Now it is enough to see that $M^J_{\bar{\alpha}} = \text{rng} (\hat{J}^*) \cap J_\alpha(V_{\lambda + 1})$. But we have that $(\hat{J}^*)^{-1}(\alpha)$ is $\bar{\lambda}_J$-good, and hence the same argument will work with $\bar{\alpha}$ replaced by $(\hat{J}^*)^{-1}(\alpha)$. So the lemma follows. \qed

We define now an ordering on certain equivalence classes of elements of $V_{\lambda}$. This is a natural ordering generated by an inverse limit $J$, and it turns out to be a well-ordering if $J \in E_1$.

**Definition 2.6.5.** Let $J \in E$, and define the ordering $\leq_J$ on tuples $(\alpha, n)$ for $\alpha < \lambda$ and $n < \omega$ as follows:

1. $(\alpha, n) \leq_J (\beta, n)$ if $\alpha \leq \beta$.
2. $(\alpha, n) \leq_J (\beta, m)$ if $n \leq m$ and $(j_n^{(n-1)} \circ \cdots \circ j_1^{(n-1)})(\alpha) \leq \beta$.
3. $(\alpha, n) \leq_J (\beta, m)$ if $m \leq n$ and $(j_m^{(m-1)} \circ \cdots \circ j_1^{(m-1)})(\beta) \leq \alpha$. 

We put \((\alpha, n) \sim_J (\beta, m)\) if \((\beta, m) \leq_J (\alpha, n)\) and \((\alpha, n) \leq_J (\beta, n)\). Let \([\alpha, n]_J\) be the equivalence class of \((\alpha, n)\) under the equivalence relation \(\sim_J\). Let \(\mathcal{J}^J\) be the set of equivalence classes \([\alpha, n]_J\) for \(\alpha < \lambda\). Let \(\mathcal{J}^J_{\leq (\gamma, m)}\) be the set of equivalence classes \([\alpha, n]_J\) such that \((\alpha, n) \leq_J (\gamma, m)\).

**Lemma 2.6.6.** Suppose \(J \in \mathcal{E}_1\). Then \((\mathcal{J}^J, \leq_J)\) is a well-ordering.

We give two separate proofs of this lemma.

**Proof 1.** Suppose the lemma fails for \(J\). For all \(n < \omega\) let \(\alpha_n\) be least such that \(\leq_J\) restricted to those elements \(\leq_J^{(n-1)}\) less than or equal to \([\alpha_n, n]_J\) is not well-founded. Then, since \(J \in \mathcal{E}_1\), for all \(n < \omega\), \(\alpha_n \in \text{rng}(j_0 \circ \cdots \circ j_{n-1})\). But by definition of the \(\alpha_n\) we clearly must have \(j_n^{(n-1)}(\alpha_n) = \alpha_{n+1}\). Hence \((\alpha_n, n) \in [\alpha_0, 0]_J\) for all \(n\). Now, let \(\langle [\beta_n, i_n]_J | n < \omega \rangle\) be a \(\leq_J\)-decreasing sequence below \([\alpha_0, 0]_J\). Then we have \(\beta_0 < \alpha_{i_0}\). But by definition of \(\alpha_{i_0}\), \(\leq_J\) is well-founded below \([\beta_0, i_0]_J\), a contradiction. \(\square\)

**Proof 2.** Suppose that \(\langle [\alpha_i, n_i]_J | i < \omega \rangle\) are such that \((\alpha_i, n_i) >_J (\alpha_{i+1}, n_{i+1})\) for all \(i < \omega\). Let \(K \in \mathcal{E}_0\) have the following properties:

1. For all \(i, n, m < \omega\), and \((\alpha, n',) \in [\alpha_i, n_i]_J\),
   \[
   (j_n^{(n-1)} \circ \cdots \circ j_{m-1}^{(n-1)})(\alpha) = (k_n^{(n-1)} \circ \cdots \circ k_{m-1}^{(n-1)})(\alpha).
   \]

2. For all \(i < \omega\) and \((\alpha, n) \in [\alpha_i, n_i]_J\) we have that
   \[
   \alpha \in \text{rng}(k_0 \circ \cdots \circ k_{n-1}).
   \]

It is then easy to see that (1) implies that for all \(i < \omega\),
\[
[\alpha_i, n_i]_J \subseteq [\alpha_i, n_i]_K,
\]
and (2) implies that for all \(i < \omega\), there exists an \(\alpha'_i\) such that
\[
(\alpha'_i, 0) \in [\alpha_i, n_i]_K.
\]
But then for all \(i < \omega\), \((\alpha_i, n_i) >_K (\alpha_{i+1}, n_{i+1})\), and hence \(\alpha'_i > \alpha'_{i+1}\), a contradiction. \(\square\)

We need the iterated version of being a limit root for inverse limits.

**Definition 2.6.7.** For \(\alpha < \omega_1\) we define an \(\alpha\)-limit root sequence \(\langle K^n | n < \alpha \rangle\) by induction as follows. A 1-limit root sequence is just \(\langle K^0 \rangle\) such that \(K^0 \in \mathcal{E}\). For \(\alpha = \beta + 1\) a successor, \(\langle K^n | n < \alpha \rangle\) is an \(\alpha\)-limit root sequence if \(\langle K^n | n < \beta \rangle\) is a \(\beta\)-limit root sequence and the following hold:

1. If \(\beta\) is a limit, then \(K^\beta\) is the common part of the sequence \(\langle K^n | n < \beta \rangle\).
2. If \( \beta \) is a successor, then \( K^\beta \) is a limit root of \( K^{\beta-1} \).

If \( \alpha \) is a limit, then \( \langle K^n \mid n < \alpha \rangle \) is an \( \alpha \)-limit root if for all \( \beta < \alpha \), \( \langle K^n \mid n < \beta \rangle \) is a \( \beta \)-limit root.

We say that \( K \) is an \( \alpha \)-limit root of \( J \) if there is an \( \alpha+1 \)-limit root sequence \( \langle K^n \mid n \leq \alpha \rangle \) such that \( K^0 = J \) and \( K^\alpha = K \). So \( K \) is a limit root of \( J \) iff \( K \) is a 1-limit root of \( J \).

Suppose \( \gamma < \Theta \) is good and suppose that \( c : \alpha \to \omega \) is a function. Then we say that \( \langle K^n \mid n < \alpha \rangle \) is an \( \alpha \)-limit root sequence following \( c \) at \( \gamma \) if the following hold:

1. For all \( n < \alpha \), \( K^n \in \mathcal{E}_\gamma \).

2. Suppose that \( \alpha = \beta + 1 \) is a successor. Then \( K^\alpha \) is a \( c(\alpha) \)-close limit root of \( K^\beta \).

**Lemma 2.6.8.** Suppose that \( \gamma < \Theta \) is good, \( \alpha < \omega_1 \), and \( c : \alpha \to \omega \) is an injection. Suppose that \( K^0 \in \mathcal{E}_{\gamma+\omega} \). Then there is \( \langle K^n \mid n < \alpha \rangle \) an \( \alpha \)-limit root sequence following \( c \) at \( \gamma \).

**Proof.** First let \( K^1 \) be a 0-close limit root of \( K^0 \) such that for all \( i < \omega \), \( k^1_i \) extends to an embedding

\[
J_{\gamma+i+1}(V_{\lambda+1}) \to J_{\gamma+i+1}(V_{\lambda+1}).
\]

For \( \alpha' < \alpha \) such that \( \alpha' = \beta + 1 \), having defined the sequence below \( \alpha' \), we choose \( K^{\alpha'} \) to be a \( c(\alpha') \)-close limit root of \( K^\beta \) such that for all \( i \in [c(\alpha'), \omega) \), if \( k^\beta_i \) extends to an embedding

\[
J_{\gamma+s_i+1}(V_{\lambda+1}) \to J_{\gamma+s_i+1}(V_{\lambda+1})
\]

then \( k^{\alpha'}_i \) extends to an embedding

\[
J_{\gamma+s_i}(V_{\lambda+1}) \to J_{\gamma+s_i}(V_{\lambda+1}).
\]

For \( \alpha' < \alpha \) a limit, we simply take \( K^{\alpha'} \) to be the common part of \( \langle K^n \mid n < \alpha' \rangle \).

Clearly this construction succeeds, as for all \( i < \omega \), the set \( \{ \alpha' < \alpha \mid c(\alpha') \leq i \} \) has cardinality less than or equal to \( i \), as \( c \) is injective. \( \square \)

We note the following fact about square roots of elementary embeddings, which we will extend to inverse limits.

**Lemma 2.6.9.** Let \( \alpha \) be good. Suppose that \( j, k : L_\alpha(V_{\lambda+1}) \to L_\alpha(V_{\lambda+1}) \) and \( k(k) = j \). Then for all \( \beta < \alpha \), we have that \( k(\beta) \geq j(\beta) \).

**Proof.** We prove this by induction on \( \beta \). If \( \beta \) is a successor or a continuity point of \( j \) then there is nothing to prove. So assume that \( \beta \) is a discontinuity point of \( j \). Let \( \gamma = \sup j'' \beta \). We have by induction that \( \gamma \leq \sup k'' \beta \). Suppose for a contradiction that \( k(\beta) < j(\beta) \). Then \( j(\beta) \) is definable in \( L_\alpha(V_{\lambda+1}) \) from \( j \upharpoonright V_{\lambda+1} \) and \( k(\beta) \), as the least image point of the unique extension of \( j \upharpoonright V_{\lambda+1} \) above \( k(\beta) \). But then \( j(\beta) \in \text{rng} k \), and since \( j \in \text{rng} k \), we have that \( \beta \in \text{rng} k \). But then \( k(\beta) = j(\beta) \), since it is a square root, a contradiction. \( \square \)
Lemma 2.6.10. Suppose $\alpha < \Theta$ is good, $\delta + 1 < \omega_1$, and $(J^\gamma | \gamma < \delta + 1)$ is a $\delta + 1$-limit root sequence from $\mathcal{E}_1$. Then for all $[\beta, n]_{J_0}$, there is an $n_0 < \omega$ such that for all $\gamma < \delta + 1$ and $m, m' \geq n_0$, if $(\beta_1, m), (\beta_2, m') \in [\beta, n]_{J_0}$ then $(\beta_1, m) \sim_{J^\gamma} (\beta_2, m')$

and hence if $J^\gamma$ extends to an embedding

$$
\tilde{J}^\gamma : J_{\alpha_\gamma + 1}(V_{\lambda_{\gamma + 1}}) \to J_{\alpha + 1}(V_{\lambda + 1})
$$

then we have

$$
\tilde{J}^{\gamma,(m-1)}_m(\beta_1) = \tilde{J}^{\gamma,(m'-1)}_m(\beta_2).
$$

Proof. Fixing $[\beta, n]_{J_0}$, we prove first that for each $\gamma < \delta$ there is such an $n_0$, the least which we call $n_\gamma$. The full lemma follows by noticing that for $\gamma$ a limit, $n_\gamma \geq \sup_{\gamma' < \gamma} n_{\gamma'}$. The proofs of these two facts are basically the same.

Let $j_i = j^0_i$ and $k_i = j_i^\gamma$ for $i < \omega$. So $K = J^\gamma$. Then we have for all $\xi < \lambda$ and $i < \omega$ that $k_i(\xi) \geq j_i(\xi)$. Hence for all $n < \omega$, if $(\alpha_n, n), (\alpha_{n+1}, n+1) \in [\beta, n]_{J}$ and $(\alpha_n, n) \prec_K (\alpha_{n+1}, n+1)$ then

$$
k^{(n-1)}_n(\alpha_n) > \alpha_{n+1} = j^{(n-1)}_n(\alpha_n).
$$

Hence, if there are infinitely many $n < \omega$ such that

$$(\alpha_n, n) \prec_K (\alpha_{n+1}, n+1),$$

then $([\alpha_n, n]_K | n < \omega)$ contains an infinite decreasing subsequence in the $\leq_K$ ordering, which is a contradiction to the well-foundedness of $\leq_K$.

For the limit step, basically the same proof works, since if $\gamma$ is such that

$$
\tilde{J}^{\gamma,(n-1)}_n(\alpha_n) > \tilde{J}^{0,(n-1)}_n(\alpha_n),
$$

then for all $\gamma' \in [\gamma, \delta$],

$$
\tilde{J}^{\gamma',(n-1)}_n(\alpha_n) > \tilde{J}^{0,(n-1)}_n(\alpha_n).
$$

And hence the lemma follows.

We need the following notation. Let $\sim$ be the equivalence relation defined as follows. Suppose $(K, \vec{k}), (K', \vec{k}')$ are such that for some $n$ and $m$,

$$(k_0 \circ \cdots \circ k_{n-1})(\langle k_n, k_{n+1}, \ldots \rangle) = (k'_0 \circ \cdots \circ k'_{m-1})(\langle k'_m, k'_{m+1}, \ldots \rangle).$$

Then $\vec{k} \sim \vec{k}'$. We let $[\vec{k}]_\sim$ denote the equivalence class which $\vec{k}$ belongs to.
Lemma 2.6.11. Suppose $\alpha < \Theta$ is good, $\delta < \omega_1$, $J \in \mathcal{E}_{\alpha+3}$, and $J$ extends to an elementary embedding

$$\hat{J} : J_{\alpha+1}(V_{\lambda_{j+1}}) \rightarrow J_{\alpha+1}(V_{\lambda+1})$$

for some $\alpha$. Then if $K \in \mathcal{E}_{\alpha+2}$ is a $\delta$-limit root of $J$, and $K$ extends to an elementary embedding

$$\hat{K} : J_{\beta+1}(V_{\lambda_{j+1}}) \rightarrow J_{\alpha+1}(V_{\lambda+1})$$

for some $\beta$ then $\beta \leq \alpha$ and for all $\gamma \leq \beta$, $\hat{K}(\gamma) \geq \hat{J}(\gamma)$.

Proof. First we prove the lemma for $\delta = 1$. This will, in essence, prove the lemma for all $\delta$ successor (assuming the limit case is true as well).

Suppose the lemma fails, and let $[\alpha, n]_J$ be $\leq J$-least such that there exists $K \in \mathcal{E}_{\alpha+2}$ a limit root of $J$ with $\hat{K}^{(n-1)}(\alpha) < \hat{J}^{(n-1)}(\alpha)$. Assume for ease of notation that $n = 0$ and that $K \in \mathcal{E}_{\alpha+2}$ is a 0-close limit root of $J$. Then we have that $\alpha$ is definable over $J_{\alpha+2}(V_{\lambda+1})$ from $J$ and $\hat{K}(\alpha)$ as the least ordinal sent by $\hat{J}$ above $\hat{K}(\alpha)$. Hence for all $n$ we have

$$(k_0 \circ \cdots \circ k_n)(\alpha) = (j_0 \circ \cdots \circ j_n)(\alpha).$$

So for all $n$ we have

$$\hat{K}^{(n-1)}(\alpha_n) < \hat{J}^{(n-1)}(\alpha_n)$$

where $\alpha_n = (j_0 \circ \cdots \circ j_{n-1})(\alpha)$.

Let $\beta$ be least such that for some $K \in \mathcal{E}_{\alpha+2}$ a limit root of $J$, $\hat{K}(\alpha) = \beta$. Then we have that $\beta < \hat{J}(\alpha)$ and $\beta \geq \sup_{\beta \leq \alpha} \hat{J}(\beta)$.

We claim that $\beta \in \text{rng } \hat{J}$, which is a contradiction. To see this, we claim that $\beta$ is definable from $[J]_\sim$ and $\hat{J}(\alpha)$ over $J_{\alpha+3}(V_{\lambda+1})$. And this follows since for any $S \in [J]_\sim$, for all large enough $n$, if

$$\alpha' = (\hat{S}^{(n-1)})^{-1}(\hat{J}(\alpha))$$

then $\beta$ is least such that for some $K \in \mathcal{E}_{\alpha+2}$ a limit root of $S_n^{(n-1)}$, $\hat{K}(\alpha') = \beta$. Hence since $[J]_\sim \in \text{rng } \hat{J}$, we have $\beta \in \text{rng } \hat{J}$.

Now we prove the lemma for $\delta$ a limit, assuming the lemma is true for all $\delta' < \delta$.

Suppose the lemma fails for $\delta$ and $\langle K^{\delta'}, \delta' < \delta \rangle$ is a limit root sequence with $K$ the common part witnessing this failure. Let $\delta' < \delta$ be least such that for some $(\beta, m)$,

$$\langle \hat{K}_{\delta'}^{(m-1)}(\beta) \rangle > \hat{K}_{\delta}^{(m-1)}(\beta).$$

Without loss of generality, by renaming, we can assume that $\delta' = 0$. Let $[\hat{\beta}, m]_{K^{\delta}}$ be $\leq K^{\delta}$-least such that for some $(\hat{\beta}_0, m_0) \in [\beta, m]_{K^{\delta}}$,

$$(\hat{K}_{m_0}^{(m_0-1)}(\hat{\beta}_0) > \hat{K}_{m_0}^{(m_0-1)}(\hat{\beta}_0).$$

Then in fact by the previous lemma, there is an $n_0$ such that for all $m' \geq n_0$ and

$$(\beta', m'), (\beta_{n_0}, n_0) \in [\beta, m]_{K^{\delta}},$$
Lemma 2.6.12.\]

\[
\beta < \alpha
\]

where \( \bar{\beta} \). So for all \( n \) we have

\[
(\beta_0, 0) \in [\bar{\beta}, m]_{\mathcal{K}^{n_0}}. \text{ Then for all } n \text{ we have }
\]

\[
(\beta_0, 0) = (k_0 \circ \cdots \circ k_n)(\beta_0).
\]

So for all \( n \) we have

\[
\hat{K}^{(n-1)}(\bar{\beta}_n) < \hat{K}^{(n-1)}(\bar{\beta}_n)
\]

where \( \bar{\beta}_n = (k_0 \circ \cdots \circ k_n)(\beta_0) \).

Let \( \beta \) be least such that for some \( K \in \mathcal{E}_{\alpha+2} \) a \( \delta \)-limit root of \( J \), \( \hat{K}(\bar{\alpha}) = \beta \). Then we have that \( \beta < \hat{J}(\bar{\alpha}) \) and \( \beta \geq \sup_{\beta < \hat{J}(\bar{\alpha})} \hat{J}(\beta) \).

We claim that \( \beta \in \text{rng } \hat{J} \), which is a contradiction. To see this, we claim that \( \beta \) is definable from \( [J]_\sim \) and \( \hat{J}(\bar{\alpha}) \) over \( J_{\alpha+3}(V_{\lambda+1}) \). And this follows since for any \( S \in [J]_\sim \), for all large enough \( n \), if

\[
\hat{\alpha}' = (\hat{S}^{(n-1)})^{-1}(\hat{J}(\bar{\alpha}))
\]

then \( \beta \) is least such that for some \( K \in \mathcal{E}_{\alpha+2} \) a \( \delta \)-limit root of \( S^{(n-1)}_n \), \( \hat{K}(\hat{\alpha}') = \beta \). Hence since \( [J]_\sim \in \text{rng } \hat{J} \), we have \( \beta \in \text{rng } \hat{J} \).

\[\square\]

Lemma 2.6.12. Let \( \alpha < \Theta \) be good and \( J \in \mathcal{E}_{\alpha+\omega} \). Then for some \( \gamma < \omega \cdot \omega \) there is \( K \in \mathcal{E}_{\alpha} \) which is a \( \gamma \)-limit root of \( J \) such that there is a saturated set \( E \) and \( \bar{\alpha} \) such that \( K \in E \) and for all \( K' \in \text{CL}(E) \), \( K' \) extends to an embedding

\[
\hat{K}' : J_{\bar{\alpha}}(V_{\lambda_{K'+1}}) \rightarrow J_{\alpha}(V_{\lambda+1}).
\]

Proof. Let \( c : \omega \cdot \omega \rightarrow \omega \) be an injection. We attempt to construct an \( \omega \cdot \omega \)-limit root sequence \( \langle K^n | n < \omega \cdot \omega \rangle \) following \( c \) at \( \alpha + 2 \) such that for all \( n < \omega \cdot \omega \) we have \( K^n \) extends to

\[
\hat{K}^n : J_{\bar{\alpha}_n}(V_{\lambda_{K'+1}}) \rightarrow J_{\alpha}(V_{\lambda+1}),
\]

and for all \( i < \omega \), \( \bar{\alpha}_{\omega \cdot i} \geq \bar{\alpha}_{\omega \cdot (i+1)} \). Clearly we can’t actually construct such a sequence. Hence our attempt must fail at some point, at which point the lemma will hold.

We construct the sequence as follows by induction for \( i < \omega \). Let \( K^0 = J \). Having constructed \( \langle K^n | n \leq \omega \cdot i \rangle \), if there exists an extension \( \langle K^n | n \leq \omega \cdot (i + 1) \rangle \) a limit root sequence following \( c \upharpoonright \omega \cdot (i + 1) \) at \( \alpha + 2 \) such that

\[
\bar{\alpha}_{\omega \cdot (i+1)} < \lim_{n \rightarrow \omega \cdot (i+1)} \bar{\alpha}_n,
\]
then use any such extension. Otherwise there is some $m < \omega$ and an extension

$$\langle K^n| n \leq \omega \cdot i + m \rangle$$

such that for all further extensions following $c$ at $\alpha + 2$, $\langle K^n| n \leq \omega \cdot (i + 1) \rangle$ we have

$$\bar{\alpha}_{\omega \cdot (i+1)} = \bar{\alpha}_{\omega \cdot i + m},$$

in which case such extensions form a saturated set as desired by the lemma.

\[\square\]

**Corollary 2.6.13.** Suppose $j : L(V_{\lambda+1}) \to L(V_{\lambda+1})$ is elementary. Then for all $\alpha < \Theta$ good, strong inverse limit reflection at $\alpha$ holds.
Chapter 3

Structural Properties of $L(V_{\lambda+1})$

3.1 Club filter on $\lambda^+$

3.1.1 Comparison with $L(\mathbb{R})$

We first give a brief summary of ultrafilters on $\omega_1$ and larger regular cardinals in $L(V_{\lambda+1})$. The starting point is the following theorem of Solovay.

**Theorem 3.1.1** (Solovay (see [KW10])). Assume $AD^{L(\mathbb{R})}$. Then in $L(\mathbb{R})$ the club filter on $\omega_1$ is a countably complete ultrafilter.

The proof proceeds by considering for $A \subseteq \omega_1$ the following sup game on $\omega_1$.

\[
\begin{array}{cccc}
I & \alpha_0 & \alpha_1 & \cdots \\
II & \beta_0 & \beta_1 & \cdots \\
\end{array}
\]

Where the rules are that

$\alpha_0 < \beta_0 < \alpha_1 < \beta_1 < \cdots < \omega_1,$

and I wins if $\sup_{i<\omega} \alpha_i \in A$. In fact, as we are assuming only $AD^{L(\mathbb{R})}$, an integer version of this game must be played, and a boundedness property used to show that if I has a winning strategy then $A$ contains a club.

For larger regular cardinals we have the following.

**Theorem 3.1.2** (Steel (see [Ste95])). Assume $AD^{L(\mathbb{R})}$. Then in $L(\mathbb{R})$ for all $\kappa < \Theta$, $\kappa$ is measurable, and this is witnessed by the $\omega$-club filter.

3.1.2 Partition measures on $\lambda^+$

We prove in this section results due to Woodin which are similar to the above results for $L(\mathbb{R})$. In particular we consider the club filter partitioned into stationary sets.
Lemma 3.1.3 (Woodin). Assume there is \( j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1}) \). Suppose that \( \gamma < \Theta \) and \( \text{cof}(\gamma) > \lambda \). Let \( S = \{ \alpha < \gamma \mid \text{cof}(\alpha) = \omega \} \) and let \( F \) be the \( \omega \)-club filter on \( \gamma \). Then there is a partition \( \langle S_\alpha \mid \alpha < \eta \rangle \in L(V_{\lambda+1}) \) of \( S \) such that \( \eta < \lambda \) and for all \( \alpha < \eta \), in \( L(V_{\lambda+1}) \) \( F \mid S_\alpha \) is an ultrafilter.

\textit{Proof.} Assume towards a contradiction that there is a partition \( \langle S_\alpha \mid \alpha < \lambda \rangle \in L(V_{\lambda+1}) \) of \( S \) into stationary subsets in \( L(V_{\lambda+1}) \). We can assume that \( \gamma \) is least such that

1. \( \lambda^+ \leq \gamma \) and \( \text{cof}(\gamma) > \lambda \),

2. and there exists such a partition of \( \{ \alpha < \gamma \mid \text{cof}(\alpha) = \omega \} \).

So we have that \( j(\gamma) = \gamma \). Let \( \langle T_\alpha \mid \alpha < \lambda \rangle = j(\langle S_\alpha \mid \alpha < \lambda \rangle) \). By elementarity \( \langle T_\alpha \mid \alpha < \lambda \rangle \) is a partition of \( S \) into stationary subsets in \( L(V_{\lambda+1}) \).

Let \( C = \{ \alpha < \gamma \mid j(\alpha) = \alpha \} \). Let \( \xi \in C \cap T_{\text{crit}(j)} \). Let \( \alpha \) be such that \( \xi \in S_\alpha \). Then \( j(\xi) = \xi \in T_{j(\alpha)} \). But this is a contradiction.

Finally, since \( F \) is \( \lambda^+ \)-complete we are done. \( \Box \)

In fact we have the following stronger theorem of Woodin.

\textbf{Theorem 3.1.4 (Woodin [Woo11]).} Suppose there is an elementary embedding

\[ j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1}). \]

Then in \( L(V_{\lambda+1}) \), \( \Theta \) is a limit of measurable cardinals, and this is witnessed by the club filter on a stationary set.

### 3.1.3 Weak-club filter

In this section we use inverse limit reflection to obtain results related to the club filter on \( \lambda^+ \) in \( L(V_{\lambda+1}) \). We cannot quite show that the \( \omega \)-club filter restricted to the cofinality \( \omega \) ordinals is an ultrafilter in \( L(V_{\lambda+1}) \), but we obtain a couple approximations to this result. Namely, we show that the weak \( \omega \)-club filter is an ultrafilter in \( L(V_{\lambda+1}) \), and that any two disjoint stationary (in \( V \)) subsets of the cofinality \( \omega \) ordinals must not be in \( L(V_{\lambda+1}) \).

These results extend to higher ordinals of cofinality greater than \( \lambda \), though for simplicity of notation we prove them for \( \lambda^+ \). We will simply state these extensions below, as the proofs are nearly identical.

Fix \( \lambda, \tilde{\lambda} < \lambda \) and a surjection \( \rho : V_{\lambda+1} \rightarrow L_{\tilde{\lambda}+}(V_{\lambda+1}) \) definable over \( L_{\tilde{\lambda}+}(V_{\lambda+1}) \). Also let \( E \) be a saturated set of inverse limits such that for all \( (J, \tilde{J}) \in E \), \( J \) extends to

\[ \tilde{J} : L_{\tilde{\lambda}+1}(V_{\lambda+1}) \rightarrow L_{\tilde{\lambda}+1}(V_{\lambda+1}). \]

Assume \( \rho \) is a surjection \( \rho : V_{\lambda+1} \rightarrow L_{\lambda^+}(V_{\lambda+1}) \) and for all \( (J, \tilde{J}) \in E \), \( \tilde{J}(\rho) = \rho \) (see the remark before Theorem 2.5.7). We will say that \( A \) tags \( b \) (over \( V_{\lambda+1} \)) if \( \rho(A) = b \), and similarly for \( \tilde{\rho} \).
Figure 3.1: The game $G(\langle \alpha_i | i < \omega \rangle, E)$, where $K^\omega$ is the common part of $\langle K^i | i < \omega \rangle$. 
Consider the following game $G(\langle \alpha_i | i < \omega \rangle, E)$ (see Figure 3.1.3), where $\langle \alpha_i | i < \omega \rangle$ is an increasing sequence of ordinals $< \bar{\lambda}^+$. 

\[
\begin{array}{ccc}
I & \beta_0 & \beta_1 & \cdots \\
II & (K^0, \vec{k}^0), A_0 & (K^1, \vec{k}^1), A_1 & \cdots \\
\end{array}
\]

With the following rules:

1. $\beta_0 < \beta_1 < \cdots < \lambda^+$ are limit ordinals.
2. For all $i$, $(K^i, \vec{k}^i) \in E$, and $K^{i+1}$ is a limit root of $K^i$.
3. Let $\hat{K}^i$ be the extension of $K^i$ to $L_{\bar{\lambda}^+}(V_{\bar{\lambda}+1})$. Then we have $\beta_0 < \hat{K}^0(\alpha_0) < \beta_1 < \hat{K}^1(\alpha_1) < \beta_2 < \cdots < \lambda^+$.
4. For all $i$, $\bar{\rho}(A_i) = \alpha_i$.
5. For all $i$ and $n \leq i$, $K^{i+1}(A_n) = K^i(A_n)$.

II wins if the game goes on $\omega$-many steps. This is a closed game for I, and hence determined.

We first show that II can win the analogous one step game.

**Lemma 3.1.5.** Let $E$ be saturated such that for all $(J, \vec{j}) \in E$, $J$ extends to $\hat{J} : L_{\bar{\lambda}^+}(V_{\bar{\lambda}+1}) \rightarrow L_{\lambda^+}(V_{\lambda+1})$.

Then for all $(J, \vec{j}) \in E$, there exists an $\alpha < \bar{\lambda}^+$ such that for all $\beta < \lambda^+$ there is a $(K, \vec{k}) \in E$, a limit root of $J$, such that $\hat{K}(\alpha) \geq \beta$.

**Proof.** Let $(J, \vec{j}) \in E$. Then for $i = i(E, J)$ (see Definition 2.1.9), we have that for all $\gamma < \lambda^+$ there exists a $(K, \vec{k}) \in E$ such that $\hat{K}_i(\gamma) = \gamma$ and hence $\hat{K}(\gamma) \geq \gamma$ for some $\gamma < \bar{\lambda}^+$. So by regularity of $\lambda^+$ there is an $\alpha < \bar{\lambda}^+$ such that for cofinally many $\beta < \lambda^+$ there is $(K, \vec{k}) \in E$, a limit root of $J$, such that $\hat{K}(\alpha) \geq \beta$, which is what we wanted. \qed

**Lemma 3.1.6.** Let $E$ be saturated such that for all $(J, \vec{j}) \in E$, $J$ extends to $\hat{J} : L_{\bar{\lambda}^+}(V_{\bar{\lambda}+1}) \rightarrow L_{\lambda^+}(V_{\lambda+1})$.

Then there exists an increasing sequence $\langle \alpha_i | i < \omega \rangle$ such that II has a quasi-winning strategy in $G(\langle \alpha_i | i < \omega \rangle, E)$. 

CHAPTER 3. STRUCTURAL PROPERTIES OF $L(V_{\lambda+1})$

Proof. Suppose towards a contradiction that for all $\bar{\alpha} \in [\bar{\lambda}^+]^\omega$ that I has a winning strategy $\sigma^{\bar{\alpha}}$ in $G(\bar{\alpha}, E)$. We use the regularity of $\lambda^+$ to play against all of these winning strategies simultaneously.

Choose a sequence $\bar{\alpha}^*$ as follows. Let

$$\beta_0^* = \sup_{\bar{\alpha} \in [\bar{\lambda}^+]^\omega} \sigma^{\bar{\alpha}}(\emptyset) < \lambda^+.$$ 

Let $K^0 \in E, A_0$ and $\alpha_0^*$ be such that $\hat{K}^0(\alpha_0^*) > \beta_0^*$ and $A_0$ tags $\alpha_0^*$. After having chosen $K^0, \ldots, K^n \in E$ and $\alpha_0^*, \ldots, \alpha_n^*$, let

$$\beta_{n+1}^* = \sup \{\sigma^{\bar{\alpha}}(\langle K^0, A_0, \ldots, K^n, A_n \rangle) | \bar{\alpha} \in [\bar{\lambda}^+]^\omega, \forall i \leq n (\alpha_i = \alpha_i^*)\}.$$ 

Let $K^{n+1} \in E, A_{n+1}$ and $\alpha_{n+1}^*$ be such that $K^{n+1}$ is a limit root of $K^n$, for all $i \leq n$, $K^{n+1}(A_i) = K^n(A_i), \hat{K}^{n+1}(\alpha_{n+1}^*) > \beta_{n+1}^*$ and $A_{n+1}$ tags $\alpha_{n+1}^*$.

We then play $\langle K^0, A^0, K^1, A^1, \ldots \rangle$ in the game $G(\bar{\alpha}^*, E)$, against the winning strategy $\sigma^{\bar{\alpha}^*}$. But by the way we chose $K^i, A_i$ and $\alpha_i^*$, this must be a winning play by II. Hence $\sigma^{\bar{\alpha}^*}$ is not a winning strategy for I, a contradiction. \hfill $\square$

Lemma 3.1.7. Let $E$ be saturated such that for all $(J, \vec{j}) \in \bar{E}, J$ extends to

$$\hat{J} : L_{\lambda^+}(V_{\lambda^+}) \rightarrow L_{\lambda^+}(V_{\lambda^+}).$$

Suppose that $\langle \alpha_i | i < \omega \rangle$ is an increasing sequence of ordinals $< \bar{\lambda}^+$ and

$$(\beta_0, K^0, A_0, \beta_1, K^1, A_1, \ldots)$$

is a winning play for II in $G(\langle \alpha_i | i < \omega \rangle, E)$. Let $K$ be the common part of $\langle K^i | i < \omega \rangle$. Then

$$\hat{K}(\sup_{i < \omega} \alpha_i) = \sup_{i < \omega} \beta_i.$$ 

Proof. Note that we have for all $i$ and $n \leq i$ that $C_n := K^{i+1}(A_n) = K^i(A_n)$. Hence we have that $K(A_n) = C_n$ and therefore $\hat{K}(\alpha_n) = \gamma_n$, where $\gamma_n$ is tagged by $C_n$. And by the rules of the game, we have

$$\beta_0 < \gamma_0 < \beta_1 < \gamma_1 < \cdots.$$ 

Hence $\hat{K}(\sup_{i < \omega} \alpha_i) = \sup_{i < \omega} \beta_i$ follows by continuity. \hfill $\square$

Theorem 3.1.8. Assume strong inverse limit reflection at $\alpha$ for $\alpha \geq \lambda^+$ good. Let

$$S_\omega = \{\beta < \lambda^+ | \text{cof}(\beta) = \omega\}.$$ 

Then if $S \in L_\alpha(V_{\lambda^+})$ and $S \subseteq S_\omega$ is stationary (in $V$), then $S_\omega \setminus S$ is not stationary.
CHAPTER 3. STRUCTURAL PROPERTIES OF $L(V_{\lambda+1})$ 58

Proof. Suppose $E$, $\bar{\alpha}$, $\gamma$ and $\bar{S}$ are such that $E \in L_\gamma(V_{\lambda+1})$ and for all $(K, \bar{k}) \in CL(E)$, $K$ extends to

$$\hat{K} : L_\alpha(V_{\lambda+1}) \to L_\alpha(V_{\lambda+1})$$

and $\hat{K}(\bar{S}) = S$. We show that for any $\langle \alpha_i | i < \omega \rangle$ such that II has a quasi-winning strategy in $G(\langle \alpha_i | i < \omega \rangle, E)$, that if $\alpha = \sup \alpha_i \in \bar{S}$ then $S$ contains a $\omega$-club.

Suppose this is not the case, so $S_\omega \setminus S$ is stationary. We have since $\alpha$ is good that in $L_\gamma(V_{\lambda+1})$ II has a quasi-winning strategy in $G(\langle \alpha_i | i < \omega \rangle, E)$. Let $M < L_\gamma(V_{\lambda+1})$ be such that $|M| = \lambda$, $S, J, E \in M$, $V_\lambda \subseteq M$, and $M \cap \lambda^+ \in S_\omega \setminus S$. Let $\langle \beta_i | i < \omega \rangle$ be increasing and cofinal in $M \cap \lambda^+$ such that for all $i$, $\beta_i \in M$. Then if I plays a legal subsequence of $\langle \beta_i | i < \omega \rangle$, at each stage there is a winning response by player II in $M$. Suppose without loss of generality (by passing to a subsequence) that the game is played as $(\bar{\beta}_i, K^0, A_0, \beta_1, K^1, A_1 \ldots)$ with $(K^i, \bar{\beta}_i) \in M$ for all $i$. Let $K$ be the common part of $\langle K^i | i < \omega \rangle$ as computed in $L(V_{\lambda+1})$. Then by the previous lemma we have that $\hat{K}(\sup \alpha_i) = \sup M \cap \lambda^+ \in S$ by elementarity. But this is a contradiction. So $S_\omega \setminus S$ is not stationary. \hfill\qedsymbol

Applying Corollary 2.6.13 we have the following.

Corollary 3.1.9. Assume there exists an elementary embedding

$$j : L(V_{\lambda+1}) \to L(V_{\lambda+1}).$$

Then there are no disjoint stationary subsets $S_1$ and $S_2$ of $\{ \beta < \lambda^+ | \text{cof}(\beta) = \omega \}$ such that $S_1, S_2 \in L(V_{\lambda+1})$.

It is unclear whether or not the conclusion follows from just an elementary embedding $j : L(V_{\lambda+1}) \to L(V_{\lambda+1})$, as it requires strong inverse limit reflection.

Definition 3.1.10. Suppose that $C \subseteq \gamma$ for $\gamma$ a limit with uncountable cofinality. Then we say that $C$ is weakly club if there exists a structure $(M, \ldots)$ in a countable language such that

$$C = \{ \alpha < \gamma | \exists (X, \ldots) \prec (M, \ldots), \sup (X \cap \gamma) = \alpha \}.$$

We say that $S \subseteq \gamma$ is weakly stationary if for all $C \subseteq \gamma$ weakly club, $S \cap C \neq \emptyset$. The weak club filter on $\gamma$ is the filter generated by the set of weakly club subsets of $\gamma$. We define weakly $\omega$-club and the weak $\omega$-club filter analogously, restricting to countable elementary substructures.

Corollary 3.1.11. Suppose there exists an elementary embedding $j : L(V_{\lambda+1}) \to L(V_{\lambda+1})$. Let $S_\omega = \{ \beta < \lambda^+ | \text{cof}(\beta) = \omega \}$. Then in $L(V_{\lambda+1})$ the weak club filter restricted to $S_\omega$ is an ultrafilter.

Proof. Assume that there exists an $\alpha$ such that $\alpha$ is good and there exists $S \in L_\alpha(V_{\lambda+1})$, $S \subseteq \lambda^+$ such that both $S$ and $S_\omega \setminus S$ are weakly stationary in $L(V_{\lambda+1})$. But by Theorem 2.5.9 inverse limit reflection holds at $\alpha$. So by the proof of Theorem 3.1.8, there is a weakly club $C \in L(V_{\lambda+1})$ such that either $C \subseteq S$ or $C \subseteq S_\omega \setminus S$, a contradiction. \hfill\qedsymbol
We can prove similar results in exactly the same way for limit ordinals $\gamma > \lambda^+$ such that $\text{cof}(\gamma) > \lambda$. For instance we have the following.

**Theorem 3.1.12.** Suppose there exists an elementary embedding

$$j : L(V_{\lambda+1}) \to L(V_{\lambda+1})$$

and that $\gamma < \Theta$ is such that $\text{cof}(\gamma) > \lambda$. Let

$$S_\omega = \{\beta < \gamma \mid \text{cof}(\beta) = \omega\}.$$  

Then if $S \in L_\alpha(V_{\lambda+1})$ and $S \subseteq S_\omega$ is stationary (in $V$), then $S_\omega \setminus S$ is not stationary.

### 3.2 Perfect set property

In this section we prove an approximation to the Perfect Set Property in $L(V_{\lambda+1})$. We regard $V_{\lambda+1}$ as a topological space with basic open sets $O(a,\alpha)$, where $\alpha < \lambda$, $a \subseteq V_\alpha$, and

$$O(a, \alpha) = \{b \in V_{\lambda+1} \mid b \cap V_\alpha = a\}.$$  

Since $\text{cof}(\lambda) = \omega$, this is a metric topology, and it is complete. Xianghui Shi and Woodin showed a similar result using Theorem 4.5.2.

**Lemma 3.2.1.** Assume $X \subseteq V_{\lambda+1}$, $X \in L(V_{\lambda+1})$, and $|X| > \lambda$. Let $\alpha < \Theta$ be good such that $X \in L_\alpha(V_{\lambda+1})$. Suppose that $E \subseteq \mathcal{E}$ is saturated and $\bar{\alpha}$ are such that for all $(J, \vec{j}) \in E$, $J$ extends to

$$\hat{J} : L_{\bar{\alpha}+1}(V_{\lambda+1}) \to L_{\alpha+1}(V_{\lambda+1})$$

and $X \in \text{rng}\hat{J}$. Then for any $(J, \vec{j}) \in \mathcal{E}$ there is an $A \in V_{\lambda+1}$ and $E' \subseteq E$ such that for

$$Y = \{A \in V_{\lambda+1} \mid \exists (K, \vec{k}) \in E' \text{ a limit root of } J \text{ such that } K(A) = A\}$$

we have $Y \subseteq X$ and $|Y| > \lambda$.

**Proof.** This follows immediately by letting $\bar{X}$ be such that $\hat{J}(\bar{X}) = X$, and setting $E' = \{(K, \vec{k}) \in E \mid \hat{K}(\bar{X}) = X\}$. Then using the fact that $|X| > \lambda$, the lemma follows.

**Lemma 3.2.2.** Suppose $E$ is a saturated set of inverse limits and $(J, \vec{j}) \in E$. Let $Z$ be the set of $A \in V_{\lambda+1}$ such that

$$|\{K(A) \mid (K, \vec{k}) \in E \text{ is a limit root of } J\}| < \lambda.$$  

Then $|Z| \leq \bar{\lambda}$.
Proof. Let \( \kappa < \lambda \) and let \( Z_\kappa \) be the set of \( A \in V_{\lambda+1} \) such that
\[
|\{K(A) | (K, \bar{k}) \in E \text{ is a limit root of } J\}| < \kappa.
\]
Suppose \( |Z_\kappa| > \bar{\lambda} \). Then if \( \bar{T} \) is the tree of initial segments of elements of \( Z_\kappa \). We have \( |[\bar{T}]| > \bar{\lambda} \). Let \( J(\bar{T}) = T \). Then by elementarity, \( |[T]| > \lambda \). But by definition of \( Z_\kappa \) we have that
\[
|\bigcup \{K'' \mid (K, \bar{k}) \in E \text{ is a limit root of } J\} \leq \bar{\lambda} \cdot \kappa < \lambda.
\]
We claim this is a contradiction. To see this, let \( i \) be such that for all \( b \in V_{\lambda+1} \) there exists \( (K, \bar{k}) \in E \) a limit root of \( J \) such that \( b \in \text{rng} \, K_i \) and \( K(\bar{T}) = T \). Let \( T_i = (j_0 \circ \cdots \circ j_{i-1})^{-1}(T) \). Then \( |T_i| = \lambda \) and for all \( b \in T_i \), there exists \( (K, \bar{k}) \in E \) a limit root of \( J \) such that \( b \in \text{rng} \, K_i \). But then \( (j_0 \circ \cdots \circ j_{i-1})(b) \in T \). And hence, since \( j_0 \circ \cdots \circ j_{i-1} \) is injective,
\[
|\bigcup \{K'' \mid (K, \bar{k}) \in E \text{ is a limit root of } J\} = \lambda,
\]
a contradiction.

The lemma follows by noting that \( \text{cof}(\lambda) = \omega \), so \( |Z| \leq \bar{\lambda} \).

\[\square\]

Theorem 3.2.3. Suppose there exists an elementary embedding
\[
j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1}).
\]
Assume \( X \subseteq V_{\lambda+1}, X \subseteq L(V_{\lambda+1}), \) and \( |X| > \lambda \). Then there is a perfect set \( Y \subseteq X \) such that \( |Y| > \lambda \) and \( Y \subseteq L(V_{\lambda+1}) \). In fact, for all \( \alpha, \alpha \in V_\lambda \) such that \( \alpha \subseteq V_\alpha \) and there exists \( b \in Y \) such that \( \alpha = b \cap V_\alpha \), we have
\[
|Y \cap O(\alpha, \alpha)| > \lambda.
\]

Proof. By \( \Sigma_1 \)-reflection, if there is a counterexample to the Theorem, then there is one below the least stable \( \delta \) of \( L(V_{\lambda+1}) \). So we prove the Theorem for subsets of \( V_{\lambda+1} \) in \( L_\delta(V_{\lambda+1}) \).

Let \( \alpha < \delta \) be good and let \( X \subseteq L_\alpha(V_{\lambda+1}) \) be such that \( X \subseteq V_{\lambda+1} \). By strong inverse limit reflection, there is \( E \subseteq \mathcal{E} \) saturated, \( \bar{\alpha} \), and \( \bar{X} \) such that for all \( (J, \bar{j}) \in CL(E) \), \( J \) extends to
\[
\bar{J} : L_{\bar{\alpha}+1}(V_{\lambda+1}) \rightarrow L_{\bar{\alpha}+1}(V_{\lambda+1})
\]
and \( \bar{J}(\bar{X}) = X \). Let \( \langle \lambda_i \mid i < \omega \rangle \) be increasing and cofinal in \( \lambda \), and let \( \langle \kappa_i \mid i < \omega \rangle \) be increasing and cofinal in \( \bar{\lambda} \).

Let \( T \subseteq V_{\bar{\lambda}} \) be a tree defined as follows. For \( i < \omega \) let
\[
T_i = \{B \in V_{\kappa_i+1} : |\{A \in V_{\lambda+1} | A \in \bar{X}, B = A \cap V_{\kappa_i}\}| > \bar{\lambda}\}
\]
and
\[
T = \{(A_0, \ldots, A_{m}) \mid \forall m \leq n(A_{im} \in T_{im} \text{ and } \forall s < m(A_{is} = A_{is} \cap V_{\kappa_is}))\}.
\]
CHAPTER 3. STRUCTURAL PROPERTIES OF $L(V_{\lambda+1})$

Let $I$ be the set

$$I = \{ \vec{s} \in [\lambda]^{<\omega} \mid \forall i < \text{len}(\vec{s}) (s_i < \lambda_i) \}.$$  

Now let

$$F : \{(\vec{A}, s) \mid \exists n, \vec{i}(\vec{A} = (A_{i_0}, \ldots, A_{i_n}) \in T, s \in I, |s| = n) \} \rightarrow E$$  

have the following properties:

1. For all $\vec{A} = (A_{i_0}, \ldots, A_{i_n}) \in T, s \in I, |s| = n - 1$, if

   $$F(\vec{A}, s \triangledown \langle \alpha \rangle) = (K, \vec{k}) \text{ and } F((\vec{A}, s \triangledown \langle \beta \rangle)) = (K', \vec{k}')$$

   for $\alpha < \beta < \lambda_n$, then $K(A_{i_n}) \neq K'(A_{i_n})$.

2. For all $\vec{A} = (A_{i_0}, \ldots, A_{i_n}) \in T, s \in I, |s| = n$, and $m < n$ if

   $$F(\vec{A}, s) = (K, \vec{k}) \text{ and } F(\vec{A} \upharpoonright m + 1, s \upharpoonright m) = (K', \vec{k}')$$

   then $K(A_{i_m}) = K'(A_{i_m})$.

3. For all $\vec{A} = (A_{i_0}, \ldots, A_{i_n}) \in T, s \in I, |s| = n - 1$ then $F(\vec{A}, s \triangledown \langle \alpha \rangle)$ is a limit root of $F(\vec{A} \upharpoonright n, s)$ for $\alpha < \lambda_{n-1}$.

Also assume that $F$ is maximal with these properties, in the sense that $F$ cannot be extended to some $F'$ also satisfying these properties.

Let $Z$ be the set of $A \in \vec{X}$ such that there exists a sequence $(i_n| n < \omega)$ such that for $A_{i_n} = A \cap V_{\kappa_{i_n}}$, for all $n < \omega$, and $s \in I$, if $|s| = n$, then $((A_{i_0}, \ldots, A_{i_n}), s) \in \text{dom}(F)$. We claim that $|\vec{X} \setminus Z| \leq \lambda$. To see this, suppose that $A \in \vec{X} \setminus Z$. Then there exists $\vec{A}$ and $s$ such that $F(\vec{A}, s) = (K, \vec{k})$, and

$$|\{K'(A) \mid (K', \vec{k}') \in E \text{ is a limit root of } K \text{ and } K'(\vec{A}) = K(\vec{A})\}| < \lambda.$$  

But for every $K$, there are $\leq \lambda$ many such $A$ with this property. Hence $|\vec{X} \setminus Z| \leq \lambda$.

So finally, let $A \in Z$, and let $(i_n| n < \omega)$ be such that for all $n < \omega$, $A_{i_n} = A \cap V_{\kappa_{i_n}}$, and

for $s \in I$, if $|s| = n$ then $((A_{i_0}, \ldots, A_{i_n}), s) \in \text{dom}(F)$. Set

$$K^{s,n} = F((A_{i_0}, \ldots, A_{i_n}), s).$$

Also for $x \in \lambda^\omega$, let $K^x$ be the common part of $\langle K^x|n,n\rangle n < \omega$, and set

$$P = \{ K^x(A) | x \in \lambda^\omega, \forall i < \omega (x_i < \lambda_i) \}.$$  

Clearly $P$ is a perfect subset of $X$ by definition of $E$ and the fact that $A \in Z \subseteq \vec{X}$. Furthermore by definition of $F$ we have $|P| > \lambda$. Note that for any $s \in I$, if we set

$$P^s = \{ K^x(A) | x \in \lambda^\omega, \forall i < \omega (x_i < \lambda_i), \forall i < |s| (s_i = x_i) \}$$

then $P^s$ is a perfect subset of $P$, $|P^s| > \lambda$ and

$$P^s = P \cap O(A_{i_n}, s_{i_n})$$  

where $n = |s|$. And hence we have the final part of the conclusion. □
Chapter 4

$U(j)$-representations

In this chapter we introduce the notion of a $U(j)$-representation, which was first defined by Woodin. For a more thorough introduction see [Woo11]. In the first section we prove a number of closure properties, which will form the basis of proving that sets in $L(V_{\lambda+1})$ have such representations. In Sections 4.2 and 4.3 we will prove certain properties of fixed point measures which we will then use in Section 4.4 to show that these representations extend considerably far in $L(V_{\lambda+1})$.

4.1 Definition and Closure Properties

For this chapter we fix $j : L(V_{\lambda+1}) \to L(V_{\lambda+1})$ elementary. We will use the notation $j(i)$ to denote the $i$-th iterate of $j$ to distinguish it from our inverse limit notation.

**Definition 4.1.1 (Woodin).** Let $U(j)$ be the set of $U \in L(V_{\lambda+1})$ such that in $L(V_{\lambda+1})$ the following hold:

1. $U$ is a $\lambda^+$-complete ultrafilter.
2. For some $\gamma < \Theta$, $U$ is generated by $U \cap L_\gamma(V_{\lambda+1})$.
3. For all sufficiently large $n < \omega$, $j(n)(U) = U$ and for some $A \in U$,
   \[
   \{ a \in A \mid j(n)(a) = a \} \in U.
   \]

For each ordinal $\kappa$, let $\Theta^{L_\kappa(V_{\lambda+1})}$ denote the supremum of the ordinals $\alpha$ such that there is a surjection $\rho : V_{\lambda+1} \to \alpha$ such that $\{(a, b) \mid \rho(a) < \rho(b)\} \in L_\kappa(V_{\lambda+1})$. Suppose that $\kappa < \Theta$ and $\kappa \leq \Theta^{L_\kappa(V_{\lambda+1})}$. Then $E(j, \kappa)$ is the set of all elementary embeddings $k : L_\kappa(V_{\lambda+1}) \to L_\kappa(V_{\lambda+1})$ such that there exists $n, m < \omega$ such that $k(n) = j(m) \upharpoonright L_\kappa(V_{\lambda+1})$. 
Suppose that $\kappa < \Theta$ and that $\kappa \leq \Theta^{L_\kappa(V_{\lambda+1})}$. For each $\delta \leq \lambda$ let $F^\delta(\mathcal{E}(j, \kappa))$ be the filter on $P(\kappa) \cap L(V_{\lambda+1})$ generated by the sets

$$\{D_\sigma | \sigma \in [\mathcal{E}(j, \kappa)]^\delta\},$$

where for each $\sigma \in [\mathcal{E}(j, \kappa)]^\delta$,

$$D_\sigma = \{b \in L_\kappa(V_{\lambda+1}) | k(b) = b \text{ for all } k \in \sigma\}.$$

**Lemma 4.1.2** (Woodin). Suppose $\kappa < \Theta$, $\kappa \leq \Theta^{L_\kappa(V_{\lambda+1})}$ and that $j(\kappa) = \kappa$. Then there is $\delta < \text{crit}(j)$ and a partition $\{S_\alpha | \alpha < \delta\} \in L(V_{\lambda+1})$ of $L_\kappa(V_{\lambda+1})$ into $F^\lambda(\mathcal{E}(j, \kappa))$-positive sets such that for each $\alpha < \delta$,

$$F^\lambda(\mathcal{E}(j, \kappa)) \upharpoonright S_\alpha \in U(j).$$

**Proof.** First, we have that since $j(\kappa) = \kappa$ that

$$j(\mathcal{E}(j, \kappa)) = \mathcal{E}(j, \kappa) \text{ and } j(F^\lambda(\mathcal{E}(j, \kappa))) = F^\lambda(\mathcal{E}(j, \kappa)).$$

Now we show that there is no sequence $\langle S_\alpha | \alpha < \text{crit}(j) \rangle \in L(V_{\lambda+1})$ of pairwise disjoint $F^\lambda(\mathcal{E}(j, \kappa))$-positive sets. This follows since

$$\{a \in L_\kappa(V_{\lambda+1}) | j(a) = a\} \in F^\lambda(\mathcal{E}(j, \kappa)),$$

and hence if

$$j(\langle S_\alpha | \alpha < \text{crit}(j) \rangle) = \langle T_\alpha | \alpha < j(\text{crit}(j)) \rangle,$$

then there exists a $\beta$ such that $\beta \in T_{\text{crit}(j)}$ and $j(\beta) = \beta$. But then by elementarity, there exists an $\alpha < \text{crit}(j)$ such that $\beta \in S_\alpha$. But then $j(\beta) = \beta \in T_\alpha$, a contradiction.

Now, since $F^\lambda(\mathcal{E}(j, \kappa))$ is $\lambda^+$-complete, there must exists a $\delta < \text{crit}(j)$ and a partition $\{S_\alpha | \alpha < \delta\} \in L(V_{\lambda+1})$ of $L_\kappa(V_{\lambda+1})$ into $F^\lambda(\mathcal{E}(j, \kappa))$-positive sets such that for each $\alpha < \delta$,

$$F^\lambda(\mathcal{E}(j, \kappa)) \upharpoonright S_\alpha \text{ is an ultrafilter.}$$

For $\alpha < \delta$, let $U_\alpha$ be the ultrafilter given by $F^\lambda(\mathcal{E}(j, \kappa)) \upharpoonright S_\alpha$. We have that $U_\alpha$ is $\lambda^+$-complete since $F^\lambda(\mathcal{E}(j, \kappa))$ is $\lambda^+$-complete. Furthermore we have that

$$B_\alpha := \{a \in S_\alpha | j(a) = a\} \in U_\alpha.$$

And hence we have that $j(U_\alpha) = U_\alpha$, since for all $\beta \in B_\alpha$, $\beta \in S_\alpha \iff \beta \in j(S_\alpha)$. So we have that for all $\alpha < \delta$, $U_\alpha \in U(j)$.

Suppose that $\kappa < \Theta$ and $\kappa \leq \Theta^{L_\kappa(V_{\lambda+1})}$. Suppose that $\langle a_i | i < \omega \rangle$ is a sequence of elements of $L_\kappa(V_{\lambda+1})$ such that for all $i < \omega$, there exists an $n < \omega$ such that $j((n)a_i) = a_i$. Let $U(j, \kappa, \langle a_i | i < \omega \rangle)$ denote the set of $U \in U(j)$ such that there exists $n < \omega$ such that for all $k \in \mathcal{E}(j, \kappa)$, if $k(a_i) = a_i$ for all $i \leq n$, then

$$\{a \in L_\kappa(V_{\lambda+1}) | k(a) = a\} \in U.$$
Definition 4.1.3 (Woodin). Suppose \( \kappa < \Theta \), \( \kappa \) is weakly inaccessible in \( L(V_{\lambda+1}) \), and \( \langle a_i \mid i < \omega \rangle \) is an \( \omega \)-sequence of elements of \( L_\kappa(V_{\lambda+1}) \) such that for all \( i < \omega \) there is an \( n < \omega \) such that \( j(n)(a_i) = a_i \).

Suppose that \( Z \in L(V_{\lambda+1}) \cap V_{\lambda+2} \). Then \( Z \) is \( U(j, \kappa, \langle a_i \mid i < \omega \rangle) \)-representable if there exists an increasing sequence \( \langle \lambda_i \mid i < \omega \rangle \), cofinal in \( \lambda \) and a function

\[
\pi : \bigcup \{ V_{\lambda_{i+1}} \times V_{\lambda_{i+1}} \times \{ i \} \mid i < \omega \} \rightarrow U(j, \kappa, \langle a_i \mid i < \omega \rangle)
\]

such that the following hold:

1. For all \( i < \omega \) and \( (a, b, i) \in \text{dom}(\pi) \) there exists \( A \subseteq (L(V_{\lambda_{i+1}}))^i \) such that \( A \in \pi(a, b, i) \).
2. For all \( i < \omega \) and \( (a, b, i) \in \text{dom}(\pi) \), if \( m < i \) then

\[
(a \cap V_{\lambda_m}, b \cap V_{\lambda_m}, m) \in \text{dom}(\pi)
\]

and \( \pi(a, b, i) \) projects to \( \pi(a \cap V_{\lambda_m}, b \cap V_{\lambda_m}, m) \).
3. For all \( x \subseteq V_{\lambda}, x \in Z \) if and only if there exists \( y \subseteq V_{\lambda} \) such that

(a) for all \( m < \omega \), \( (x \cap V_{\lambda_m}, y \cap V_{\lambda_m}, m) \in \text{dom}(\pi) \),

(b) the tower

\[
\langle \pi(x \cap V_{\lambda_m}, y \cap V_{\lambda_m}, m) \mid m < \omega \rangle
\]

is well founded.

For \( Z \in L(V_{\lambda+1}) \cap V_{\lambda+2} \) we say that \( Z \) is \( U(j) \)-representable if there exists \( \langle \kappa, \langle a_i \mid i < \omega \rangle \rangle \) such that \( Z \) is \( U(j, \kappa, \langle a_i \mid i < \omega \rangle) \).

We first show some basic facts about this definition.

Lemma 4.1.4 (Woodin). Suppose that \( Z \) is \( U(j, \kappa, \langle a_i \mid i < \omega \rangle) \)-representable and \( \langle b_i \mid i < \omega \rangle \) is such that for all \( i \) there exists an \( n \) such that

\[ j(n)(b_i) = b_i. \]

Then \( Z \) is \( U(j, \kappa, \langle (a_i, b_i) \mid i < \omega \rangle) \)-representable.

Proof. It is enough to show that

\[ U(j, \kappa, \langle a_i \mid i < \omega \rangle) \subseteq U(j, \kappa, \langle (a_i, b_i) \mid i < \omega \rangle). \]

To see this, suppose that \( U \in U(j, \kappa, \langle a_i \mid i < \omega \rangle) \). So there exists an \( n \) such that for all \( k \in \mathcal{E}(j, \kappa) \), if \( k(a_i) = a_i \) for all \( i \leq n \), then

\[ \{ a \in L_\kappa(V_{\lambda+1}) \mid k(a) = a \} \subseteq U. \]

But requiring that \( k((a_i, b_i)) = (a_i, b_i) \) for all \( i \leq n \) is an even stronger condition. So \( U \in U(j, \kappa, \langle (a_i, b_i) \mid i < \omega \rangle) \).
Lemma 4.1.5 (Woodin). Suppose that $Z$ is $U(j, \kappa_0, \langle a_i | i < \omega \rangle)$-representable, $\kappa_0 < \kappa_1 < \Theta$ and $\kappa_1 \leq \Theta^{L_{\kappa_1}(V_{\lambda+1})}$. Then $Z$ is $U(j, \kappa_1, \langle b_i | i < \omega \rangle)$-representable where $b_0 = (a_0, \kappa_0)$ and $b_i = a_i$ for $i > 0$.

We now want to show certain closure properties for $U(j)$-representations. While closure under $\lambda$-unions and existential quantification is pretty much immediate, we will see that closure under complementation is much more involved and requires a property called the Tower Condition.

Lemma 4.1.6 (Woodin). Suppose that $\lambda < \kappa < \Theta$, $\kappa \leq \Theta^{L_{\kappa}(V_{\lambda+1})}$ and $\text{cof}(\kappa) > \lambda$. Let $N$ be the collection of sets which are $U(j, \kappa, \langle a_i | i < \omega \rangle)$ in $L(V_{\lambda+1})$ for some $\langle a_i | i < \omega \rangle$. If $N_0 \subseteq N$, $|N_0| \leq \lambda$, then $\bigcup N_0 \in N$.

Proof. For each $Z \in N_0$ there is $\langle (\lambda^Z_i, a^Z_i) | i < \omega \rangle$ and

$$\pi_Z : \bigcup \{V_{\lambda^Z_i+1} \times V_{\lambda^Z_i+1} \times \{i\} | i < \omega \} \rightarrow U(j, \kappa, \langle a^Z_i | i < \omega \rangle)$$

witnessing that in $L(V_{\lambda+1})$, $Z$ is $U(j)$-representable. We can assume without loss of generality that there is a $\langle \lambda_i | i < \omega \rangle$ such that for all $Z \in N_0$, $\langle \lambda^Z_i | i < \omega \rangle = \langle \lambda_i | i < \omega \rangle$.

Let $\langle \kappa_i | i < \omega \rangle$ be the critical sequence of $j$, and let $\langle Z_{\alpha} | \alpha < \lambda \rangle$ be an enumeration of $N_0$. For each $n < \omega$, let

$$a_n = \{a^Z_{\alpha} | \alpha < \kappa_n \text{ and } j(n)(a^Z_{\alpha}) = a^Z_{\alpha}\}.$$

Since $\text{cof}(\kappa) > \lambda$ we have that

1. For all $n < \omega$, $a_n \in L_\kappa(V_{\lambda+1})$ and $|a_n| < \lambda$.
2. For all $Z \in N_0$, for all $i < \omega$, $a^Z_i \in \bigcup \{a_n | n < \omega\}$.
3. For all $n < \omega$, there exists $m < \omega$ such that $j(m)(a_n) = a_n$.

Hence by the above lemma we are done. \qed

Lemma 4.1.7 (Woodin). Suppose that $Z \subseteq \{x \times y | x, y \in V_{\lambda+1}\}$ and $Z$ is $U(j, \kappa, \langle a_i | i < \omega \rangle)$-representable. Let

$$Y = \{x \in V_{\lambda+1} | \exists y \in V_{\lambda+1} (x \times y \in Z)\}.$$ 

Then $Y$ is $U(j, \kappa, \langle a_i, i < \omega \rangle)$-representable.

Proof. Let

$$\pi : \bigcup \{V_{\lambda+1} \times V_{\lambda+1} \times \{i\} | i < \omega \} \rightarrow U(j, \kappa, \bar{a})$$

witness that $Z$ is $U(j, \kappa, \bar{a})$-representable where $\langle \lambda_i | i < \omega \rangle$ is the critical sequence of $j$. We construct a function

$$\pi_Y : \bigcup \{V_{\lambda+1} \times V_{\lambda+1} \times \{i\} | i < \omega \} \rightarrow U(j, \kappa, \bar{a})$$
which witnesses that $Y$ is $U(j, \kappa, \vec{a})$-representable.

The main point is the following continuity property. We have that if $x, y \in V_{\lambda+1}$ then

$$x \times y = \{(a, b) \in x_i \times y_i | i < \omega, x_i = x \cap V_{\lambda_i}, y_i = y \cap V_{\lambda_i}\},$$

and on the other hand if $\langle x_i | i < \omega \rangle$ and $\langle y_i | i < \omega \rangle$ are sequences such that for all $i$, $x_i = x_{i+1} \cap V_{\lambda_i}$ and $y_i = y_{i+1} \cap V_{\lambda_i}$ then for $x = \bigcup_i x_i$ and $y = \bigcup_i y_i$ we have

$$x \times y = \bigcup_i x_i \times y_i.$$

We define $\pi_Y$ such that the following hold:

1. Suppose $(a, b) \in V_{\lambda+1} \times V_{\lambda+1}$ and $a = x \times y$ for some $x, y \in V_{\lambda+1}$. Then for all $i < \omega$,

   $$\pi(a \cap V_{\lambda_i}, b \cap V_{\lambda_i}, i) = \pi_Y(x \cap V_{\lambda_i}, c \cap V_{\lambda_i}, i)$$

   where $c = y \times b$.

2. If $x_0, c_0 \subseteq V_{\lambda_i}$ are such that there is no $(a, b), (x, y) \in V_{\lambda+1} \times V_{\lambda+1}$ with $a = x \times y$, $x_0 = x \cap V_{\lambda_i}$ and $c_0 = c \cap V_{\lambda_i}$ then

   $$(x_0, c_0, i) \notin \text{dom}(\pi_Y).$$

Then clearly $\pi_Y$ witnesses that $Y$ is $U(j, \kappa, \langle a_i | i < \omega \rangle)$-representable.

We now introduce the Tower Condition, a continuous ill-foundedness condition, which is the key property needed to show closure of $U(j)$-representations under complementation.

**Definition 4.1.8** (Woodin). Suppose $A \subseteq U(j)$, $A \in L(V_{\lambda+1})$, and $|A| \leq \lambda$. The *Tower Condition for $A$* is the following statement: There is a function $F : A \rightarrow L(V_{\lambda+1})$ such that the following hold:

1. For all $U \in A$, $F(U) \in U$.

2. Suppose $\langle U_i | i < \omega \rangle \in L(V_{\lambda+1})$ and for all $i < \omega$, there exists $Z \in U_i$ such that

   $$Z \subseteq L(V_{\lambda+1})^i, \quad U_i \in A, \quad \text{and} \quad U_{i+1} \text{ projects to } U_i.$$

   Then the tower $\langle U_i | i < \omega \rangle$ is wellfounded in $L(V_{\lambda+1})$ if and only if there exists a function $f : \omega \rightarrow L(V_{\lambda+1})$ such that for all $i < \omega$,

   $$f \upharpoonright i \in F(U_i).$$

The *Tower Condition for $U(j)$* is the statement that for all $A \subseteq U(j)$ if $A \in L(V_{\lambda+1})$ and $|A| \leq \lambda$ then the Tower Condition holds for $A$. 
Lemma 4.1.9 (Woodin). Assume that the tower condition holds for \(U(j)\). Suppose that \(\gamma_0 < \gamma_1 < \gamma_2\) are weakly inaccessible cardinals in \(L(V_{\lambda+1})\) such that \(j(\gamma_0, \gamma_1, \gamma_2) = (\gamma_0, \gamma_1, \gamma_2)\) and such that

\[
L_{\gamma_0}(V_{\lambda+1}) \prec L_{\gamma_1}(V_{\lambda+1}) \prec L_{\gamma_2}(V_{\lambda+1}) \prec L_{\Theta}(V_{\lambda+1}).
\]

Suppose that \(Z\) is \(U(j, \gamma_0, \langle a_i | i < \omega \rangle)\)-representable. Then there exists a sequence \(\langle b_i | i < \omega \rangle\) such that \(V_{\lambda+1} \setminus Z\) is \(U(j, \gamma_2, \langle b_i | i < \omega \rangle)\)-representable.

Proof. Fix \(\pi\) witnessing that \(Z\) is \(U(j, \gamma_0, \langle a_i | i < \omega \rangle)\)-representable in \(L(V_{\lambda+1})\). Let

\[
\langle \kappa_i | i < \omega \rangle
\]

be the critical sequence of \(j\) and assume that for all \(i < \omega\), \(\lambda_i = \kappa_i\), \(|a_i| \leq \kappa_i\) and

\[
\forall n > i \ (j_{(n)}(a_i) = a_i \text{ and } j_{(n)}(\pi \upharpoonright V_{\kappa_i+\omega}) = \pi \upharpoonright V_{\kappa_i+\omega}).
\]

For each \(n < \omega\) let \(\mathcal{E}_n\) be the set of all elementary embeddings

\[
k : L_{\gamma_1}(V_{\lambda+1}) \rightarrow L_{\gamma_1}(V_{\lambda+1})
\]

such that \(k(\gamma_0) = \gamma_0\), \(k \in \mathcal{E}(j, \gamma_1)\) and for all \(i \leq n\),

\[
k(a_i) = a_i \text{ and } k(\pi \upharpoonright V_{\kappa_i+\omega}) = \pi \upharpoonright V_{\kappa_i+\omega}.
\]

Note that \(\langle \mathcal{E}_n | n < \omega \rangle \in L_{\gamma_2}(V_{\lambda+1})\).

For each \(\sigma \in [\mathcal{E}_n]^{\lambda}\), let

\[
D_\sigma = \{a \in L_{\gamma_1}(V_{\lambda+1}) | k(a) = a \text{ for all } k \in \sigma\},
\]

and let \(\mathcal{F}_n\) be the filter generated by \(\{D_\sigma | \sigma \in [\mathcal{E}_n]^{\lambda}\}\).

We have that for all \(n < \omega\) and \(m > n\) that \(j_{(m)}(\mathcal{E}_n) = \mathcal{E}_n\). So we have that for all \(n < \omega\) there is partition \(\langle S_{n,\alpha} | \alpha < \delta_n \rangle \in L_{\gamma_2}(V_{\lambda+1})\) of \(L_{\gamma_1}(V_{\lambda+1})\) into \(\mathcal{F}_n\)-positive sets such that \(\delta_n < \kappa_{n+1}\) and for each \(\alpha < \delta_n\), \(\mathcal{F}_n \upharpoonright S_{n,\alpha}\) is an ultrafilter (see Lemma 4.1.2). For each \(n < \omega\) and \(\alpha < \delta_n\) let \(U_{n,\alpha}\) be the ultrafilter on \(S_{n,\alpha}\) given by \(\mathcal{F}_n\).

Let \(A = \{U_{n,\alpha} | n < \omega, \alpha < \delta_n\}\). We have that \(A \in L(V_{\lambda+1})\), \(|A| \leq \lambda\), \(A \subseteq U(j)\) and \(\text{rng}(\pi) \subseteq A\).

Let \(F : A \rightarrow L(V_{\lambda+1})\) be a function witnessing the tower condition such that \(F \in L(V_{\lambda+1})\). We have that

\[
\langle F(U_{n,\alpha}) | n < \omega, \alpha < \delta_n \rangle \in L_{\gamma_2}(V_{\lambda+1}).
\]

There exists a set \(T_A^0 \subseteq (L_{\gamma_1}(V_{\lambda+1}))^{<\omega}\) such that the following hold:

1. \(T_A^0 \subseteq L_{\gamma_2}(V_{\lambda+1})\).

2. For all \(U \in A\), there exists \(B \subseteq T_A^0\) such that \(B \subseteq U\).
3. For all $U_1 \in A$ and $U_2 \in A$, if $U_1 \neq U_2$ then $F(U_1) \cap F(U_2) \cap T_A^0 = \emptyset$.

4. For all $s \in T_A^0$ there exists $U \in A$ such that $s \in F(U)$.

Such a $T_A^0$ exists as $|A| \leq \lambda$ and each $U \in A$ is $\lambda^+$-complete. We also have that for each $s \in T_A^0$, there is exactly one $U \in A$ such that $s \in F(U)$, which we denote $U_s$. Furthermore, for each $n < \omega$,

$$|\{U_s| s \in T_A^0 \cap (L_{\gamma_1}(V_{\lambda+1}))^n]\} \leq \delta_n < \kappa_{n+1}.$$

Let $T_A$ be the set of all $s \in T_A^0$ such that

$$(L(V_{\lambda+1}), s) \equiv_{\Sigma_2} (L(V_{\lambda+1}), t)$$

with parameters from $V_\lambda \cup \{T_A^0, F, A, \pi, Z, \gamma_0, \gamma_1, \gamma_2\}$, for $U_s$-almost all $t$. We have that $T_A$ is closed under initial segments and it satisfies 1-4 above. $T_A$ also satisfies that if $s \in T_A$ and $t$ is an initial segment of $s$, then $U_s$ projects to $U_t$. Hence we have that for each $f \in [T_A]$, the tower $\langle U_f| i < \omega \rangle$ is wellfounded by definition of the tower function.

For each $U \in A$, let Ult$(L_{\gamma_2}(V_{\lambda+1}), U)$ be the ultrapower computed using only functions $f : L_{\gamma_1}(V_{\lambda+1}) \to L(V_{\lambda+1})$ such that $f \in L_{\gamma_2}(V_{\lambda+1})$. We let $[f]_U$ denote the element of Ult$(L_{\gamma_2}(V_{\lambda+1}), U)$ given by $f$. If $\text{rng } (f) \subseteq \gamma_2$, we let $\xi_U^f$ be the ordinal in the transitive collapse of Ult$(L_{\gamma_2}(V_{\lambda+1}), U)$ given by $[f]_U$. We have that $\xi_U^f < \gamma_2$ since $U \in U(j, \gamma_1)$ and $L_{\gamma_2}(V_{\lambda+1}) \prec L_\Theta(V_{\lambda+1})$.

Let $\sigma \in [\mathcal{E}(j, \gamma_1)]^\lambda$ be such that for all $n < \omega$,

$$D_{\sigma_n} \cap (L_{\gamma_1}(V_{\lambda+1}))^n \subseteq T_A$$

where $\sigma_n = \mathcal{E}_n \cap \sigma$. And let $C = \{\xi < \gamma_1 | \forall k \in \sigma(k(\xi) = \xi)\}$. Note that $C^{<\omega} \subseteq T_A$.

We have the following: Suppose $(a, b) \in V_{\lambda+1} \times V_{\lambda+1}$ and that the tower

$$\langle U_i| i < \omega \rangle = \langle \pi(a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i)| i < \omega \rangle$$

is not wellfounded. There is a sequence of functions $\langle f_i| i < \omega \rangle$ such that for all $i$,

$$f_i : (L_{\gamma_0}(V_{\lambda+1}))^i \to C$$

and such that for all $i_1 < i_2 < \omega$, $j_{i_1, i_2}(\xi_{U_{i_1}}^{f_{i_1}}) > \xi_{U_{i_2}}^{f_{i_2}}$. Here

$$j_{i_1, i_2} : \text{Ult}(L_{\gamma_2}(V_{\lambda+1}), U_{i_1}) \to \text{Ult}(L_{\gamma_2}(V_{\lambda+1}), U_{i_2})$$

is given by the fact that $U_{i_2}$ projects to $U_{i_1}$. This follows from the fact that $\gamma_0 < \gamma_1$ are both weakly inaccessible and $L_{\gamma_0}(V_{\lambda+1}) \prec L_{\gamma_1}(V_{\lambda+1}) \prec L_\Theta(V_{\lambda+1})$.

Now suppose that $a \in V_{\lambda+1} \setminus Z$. Then for each $b \in V_{\lambda+1}$, the tower

$$\langle \pi(a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i)| i < \omega \rangle$$
is not wellfounded. Since $F$ witnesses that the tower condition holds for $A \supseteq \text{rng}(\pi)$, for each $b \in V_{\lambda+1}$, there is no function $h : \omega \to L(V_{\lambda+1})$ such that for all $i < \omega$, 
\[ h \upharpoonright i \in F(\pi(a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i)). \]
Thus there exists
\[ e : \{(a \cap V_{\kappa_i}, x, i) \mid i < \omega, x \subseteq V_{\kappa_i}\} \times (L_{\gamma_0}(V_{\lambda+1})))^{< \omega} \to C \]
such that for all $b \in V_{\lambda+1}$ and $i_1 < i_2 < \omega$, $j_{i_1,i_2}(\xi_{U_{i_1}^{f_{i_2}}}) > \xi_{U_{i_2}^{f_{i_2}}}$, where for each $i < \omega$, $U_i = \pi(a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i)$, and for all $s \in L_{\gamma_0}(V_{\lambda+1})$,
\[ f(s) = e((a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i), s). \]
To define such an $e$, let $T$ be the tree given by $F$ restricted to $\pi(a \cap V_{\kappa_i}, b_i, i)$ such that $i < \omega$, $b_i \subseteq V_{\kappa_i}$ and $(a \cap V_{\kappa_i}, b_i, i) \in \text{dom}(\pi)$. Then for each $s \in F(\pi(a \cap V_{\kappa_i}, b_i, i))$ let $e((a \cap V_{\kappa_i}, b_i, i), s)$ be the rank of $s$ in $T$.
Define a function
\[ e_a : \{(a \cap V_{\kappa_i}, x, i) \mid i < \omega, x \subseteq V_{\kappa_i}\} \to \gamma_1 \]
as follows. For each $i < \omega$ and $x \in V_{\kappa_i+1}$,
\[ e_a(a \cap V_{\kappa_i}, x, i) = \xi_U^f \]
where $U = \pi(a \cap V_{\kappa_i}, x \cap V_{\kappa_i}, i)$ and for all $s \in L_{\gamma_0}(V_{\lambda+1})$,
\[ f(s) = e((a \cap V_{\kappa_i}, x, i), s). \]
Finally for each $n < \omega$, let $s_n = \langle e_a \upharpoonright V_{\kappa_i+\omega} \upharpoonright i \leq n \rangle$. We have that for all $n < \omega$, $s_n \in T_A$, since for all $k \in \sigma_n$, $k(s_n) = s_n$. So the tower $\langle U_{s_n} \mid n < \omega \rangle$ is wellfounded.
Let $T^*$ be the set of all $(a \cap V_{\kappa_i}, s) \in V_\lambda \times T_A$ such that $a \in V_{\lambda+1} \times Z$ and there is a function $e$ as above such that $s = \langle e_a \mid V_{\kappa_i+\omega} \upharpoonright i \leq n \rangle$.
Suppose $(a, e) \in [T^*]$. Then by definition of $T_A$,
\[ e : \{(a \cap V_{\kappa_i}, x, i) \mid i < \omega, x \subseteq V_{\kappa_i}\} \to \text{Ord} \]
and for all $b \subseteq V_\lambda$, if
\[ \langle U_i \mid i < \omega \rangle = \langle \pi(a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i) \mid i < \omega \rangle \]
and
\[ \langle \xi_i \mid i < \omega \rangle = \langle e(a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i) \mid i < \omega \rangle \]
then for all $i_1 < i_2$, $j_{i_1,i_2}(\xi_{i_1}) > \xi_{i_2}$. So for all $b \in V_{\lambda+1}$, the tower $\langle \pi(a \cap V_{\kappa_i}, b \cap V_{\kappa_i}, i) \mid i < \omega \rangle$ is not wellfounded, and so $a \notin Z$.
Thus
1. \{a \in V_{\lambda+1} \mid (a, e) \in [T^*] \text{ for some } e \} = V_{\lambda+1} \setminus Z.

2. For each \((a, e) \in [T^*]\), the tower \(<U_i \mid i < \omega>\) is wellfounded where for all \(i < \omega, U_i = U_{e|i}.\)

3. For each \((a_0, e_0) \in [T^*]\) and \(i < \omega,\)

\[|\{U_{e_1|i}\mid (a_1, e_1) \in [T] \text{ and } a_1 \cap V_{\kappa_i} = a_0 \cap V_{\kappa_i}\}| < \kappa_{i+1}.\]

Let \(\langle b_i \mid i < \omega \rangle = \langle \pi \upharpoonright V_{\kappa_{i+\omega}} \mid i < \omega \rangle.\) Then \(V_{\lambda+1} \setminus Z\) is \(U(j, \gamma_2, \langle b_i \mid i < \omega \rangle)-\)representable.

4.2 The Tower Condition

For the proof of the Tower Condition we do not actually use inverse limit reflection. Instead, we use the structure of the inverse limits together with their ‘naive extensions’ above \(\lambda.\) Because of this difference we define for \(\alpha < \Theta,\)

\[E^e_\alpha = \{(J, \vec{j}) \mid (J, \vec{j} \upharpoonright V_{\lambda+1}) \in E, \forall i (j_i : L_\alpha(V_{\lambda+1}) \to L_\alpha(V_{\lambda+1}))\}.\]

Suppose that \((J, \vec{j}) \in E^e_\alpha.\) Then we say that \(a \in L_\alpha(V_{\lambda+1})\) is in the extended range of \(J\) if for all \(i < \omega, a \in \text{rng}(j_0 \circ \cdots \circ j_i).\) We set \(J^\text{ext}(b) = a \text{ if for some } n < \omega, \text{ for all } i \geq n,\)

\[(j_0 \circ \cdots \circ j_i)^{-1}(a) = b.\]

Again, we omit the sequence of embeddings from our notation.

**Lemma 4.2.1.** Suppose \(\alpha\) is good and \((J, \langle j_i \rangle) \in E^e_\alpha\) is an inverse limit such that for all \(i, j_i(j_i) = j \upharpoonright L_\alpha(V_{\lambda+1}).\) Let \(U \in L_\alpha(V_{\lambda+1})\) be in the extended range of \(J\) and such that for some \(i, j_i(U) = U.\) Let

\[j_0(U_0) = U, j_1(U_1) = U_0, \ldots.\]

Then there exists an \(n\) such that for all \(m \geq n, U^m = U^m.\) Furthermore, for this \(n\) we have that for all \(m \geq n, j_m(U) = U\) (see Section 2.1).

**Proof.** Note that \(j_{(n)}\) denotes the \(n\)th iterate of \(j,\) and \(j_n\) denotes the \(n\)th element of the inverse limit sequence. Let \(m\) be such that \(j_{(m-1)}(U) = U.\) We prove by induction that for \(n \geq m\) we have \(j_n(U^n) = U^n.\) First suppose that \(m = 1.\) Then \(j(U) = U.\) We have that

\[j(U) = U \Rightarrow j_0(j_0)(U) = U \Rightarrow j_0(U^0) = U^0.\]

And hence \(U^0 = U.\) The fact that \(j_n(U^n) = U^n\) follows by induction.
Now suppose that \( m > 1 \). Assume by induction that we have proved the result for all \( m' < m \). Then we have for \( n = m - 1 \)

\[
j_{(n)}(U) = U \Rightarrow (j_0(j_0))_{(n)}(U) = U \Rightarrow (j_0)_{(n)}(U^0) = U^0 \Rightarrow j_{(n-1)}(U^0) = U^0.
\]

And then using the induction hypothesis on \( U^0 \) and \( \langle j_i \mid i \geq 1 \rangle \) we have the first result.

To see the second result, simply note that \( U^{m-1} = j_m(U^m) = U^m \), and hence

\[
j_m(U^m) = U^m \Rightarrow j_m(U^{m-1}) = U^{m-1} \Rightarrow j_{(m-1)}((j_0 \circ \cdots \circ j_{m-1})(U^{m-1})) = (j_0 \circ \cdots \circ j_{m-1})(U^{m-1}) \Rightarrow j_{(m-1)}(U) = U,
\]

for any \( m \geq n \), for \( n \) satisfying the first part of the conclusion (where \( U^{-1} = U \)). \( \square \)

**Lemma 4.2.2.** Suppose that \( A \in L_\Theta(V_{\lambda+1}) \), \( |A| \leq \lambda \) and for all \( a \in A \), there exists an \( i \) such that \( j_{(i)}(a) = a \). Then there exists a sequence \( \langle B_i \mid i < \omega \rangle \) and \( (K, \langle k_i \mid i < \omega \rangle) \in \mathcal{E}_\eta^e \) for some \( \eta < \Theta \) good such that,

1. for all \( i < \omega \), \( B_i = (k_0 \circ \cdots \circ k_{i-1})(B_0) \),
2. \( A \subseteq \lim_{i \rightarrow \omega} B_i := \{ a \mid \exists n \forall i \geq n (a \in B_i) \} \),
3. for all \( i < \omega \), \( k_i(k_i) = j \upharpoonright L_\alpha(V_{\lambda+1}) \),
4. for all \( a \in \lim_{i \rightarrow \omega} B_i \), there is an \( i < \omega \) such that \( k_i^{(i)}(a) = a \),
5. for all \( a \in \lim_{i \rightarrow \omega} B_i \), there is an \( i < \omega \) such that \( a \in \text{rng}(K_i^{(i)})^{\text{ext}} \).

**Proof.** Let \( C = \langle U_\alpha \mid \alpha < \lambda \rangle \) be an enumeration of \( A \), and let \( \eta < \Theta \) be good and large enough so that \( C, A \in L_\eta(V_{\lambda+1}) \). Let \( (K, \langle k_i \mid i < \omega \rangle) \in \mathcal{E}_\eta^e \) be such that for all \( i < \omega \), \( k_i(k_i) = j \upharpoonright L_\alpha(V_{\lambda+1}) \),

\[
k_0(C_0) = C, \ k_0(A_0) = A
\]

and for \( i > 0 \),

\[
k_i(C_i) = C_{i-1}, \ k_i(A_i) = A_{i-1}.
\]

Let \( \bar{\lambda} = \bar{\lambda}_K \). Set

\[
B_0 = \lim_{i \rightarrow \omega} C_i \upharpoonright \bar{\lambda}.
\]

Let \( B_i = (k_0 \circ \cdots \circ k_{i-1})(B_0) \).

We want to show that for \( \alpha < \text{crit}(k_0) \), that \( U_\alpha \in \lim_{i \rightarrow \omega} B_i \). But this follows by Lemma 4.2.1. To see this, by induction define \( U^i_\alpha \) for \( i < \omega \) as follows: \( k_0(U^0_\alpha) = U_\alpha \) and for \( i \geq 0 \), \( k_{i+1}(U^{i+1}_\alpha) = U^i_\alpha \). Then by the lemma we have that for some \( n \), \( U^n_\alpha = U^n_\alpha \) for all \( i \geq n \). Hence \( U^n_\alpha \in B_0 \). We want that for all \( i \geq n \), \( U_\alpha \in B_{i+1} \). But this follows since

\[
U^n_\alpha = U^n_\alpha \in B_0 \Rightarrow (k_0 \circ \cdots \circ k_i)(U^n_\alpha) = U_\alpha \in B_{i+1}.
\]
Similarly, we have that for \( \alpha < (k_0 \circ \cdots \circ k_{i-1})(\text{crit } k_i) \), \( U_\alpha \in \lim_{i \to \omega} B_i \). For ease of notation we prove this for \( i = 1 \). The proof for \( i > 1 \) is very similar. So we want for \( \alpha < k_0(\text{crit } k_1) \), that \( U_\alpha \in \lim_{i \to \omega} B_i \). To see this, by induction define \( U_\alpha^i \) for \( i < \omega \) as follows: 
\[ k_1^{(0)}(U_\alpha^1) = U_\alpha \] 
and for \( i \geq 1 \), 
\[ k_1^{(0)}(U_\alpha^{i+1}) = U_\alpha^i. \] 
Then by Lemma 4.2.1 we have that for some \( n \), \( U_\alpha^n = U_\alpha^i \) for all \( i \geq n \). We want to see that \( U_\alpha^n \in B_1 \). We have
\[ B_1 = k_0(\lim_{i \to \omega} C_i \upharpoonright \bar{\lambda}) = \lim_{i \to \omega} k_0(C_i) \upharpoonright k_0(\bar{\lambda}), \]
and furthermore
\[ k_0(k_1 \circ \cdots \circ k_i)(k_0(C_i)) = C. \]
Hence using that \( k_0(\text{crit } k_1) = \text{crit } (k_0(k_1 \circ \cdots \circ k_i)) \) and \( \alpha < k_0(\text{crit } k_1) \) we have that \( U_\alpha^n \in B_1 \).
We show that for all \( i \geq n \), \( U_\alpha \in B_{i+1} \). But this follows since
\[ U_\alpha^n = U_\alpha^i \in B_1 \Rightarrow k_0(k_1 \circ \cdots \circ k_i)(U_\alpha^i) = U_\alpha \in B_{i+1}. \]
Note that
\[ B_i = k_0(k_1 \circ \cdots \circ k_{i-1})(k_0(B_0)) = k_0(k_1 \circ \cdots \circ k_{i-1})(B_1). \]
But
\[ \sup_{i < \omega}(k_0 \circ \cdots \circ k_{i-1})(\text{crit } k_i) = \lambda. \]
So \( A \subseteq \lim_{i \to \omega} B_i \).
Note that we have for all \( U \in \lim_{i \to \omega} B_i \), that there is an \( i \) such that \( j_i^{(i-1)}(U) = U \), using the proof of Lemma 4.2.1 together with above argument.

**Theorem 4.2.3.** Suppose \( A \subseteq U(j) \), \( A \in L(V\lambda+1) \), \( |A| \leq \lambda \). Then the tower condition for \( A \) holds.

**Proof.** Let \( A \subset U(j) \), \( |A| = \lambda \), and \( A \in L(V\lambda+1) \). Let \( \langle B_i \mid i < \omega \rangle \), \( \eta < \Theta \) be good, \( L_\eta(V\lambda+1) \prec_{\Sigma_1} L_\Theta(V\lambda+1) \), and \( (j, \langle j_i \mid i < \omega \rangle) \in E_{\eta+2}^+ \) be such that, \( A \subseteq \lim_{i \to \omega} B_i \), for all \( i < \omega \), \( j_i(j_i) = j \upharpoonright L_\eta(V\lambda+1) \), and for \( i < \omega \),
\[ B_i = (j_0 \circ \cdots \circ j_{i-1})(B_0). \]

Since \( |B_0| < \lambda \), \( \lambda \)-DC holds in \( L(V\lambda+1) \), and each measure in \( A \) is \( \lambda^+ \)-complete, there is a tower function \( F_0 \in L_\eta(V\lambda+1) \) for \( B_0 \). Define for \( i > 0 \),
\[ (j_0 \circ \cdots \circ j_{i-1})(F_0) = F_i. \]
Let \( B := \lim_{i \to \omega} B_i \), and for \( U \in B \) define
\[ F(U) = \bigcap \{ F_i(U) \cap \{ a \in L(V\lambda+1) \mid j_i(a) = a \} \mid i < \omega, U \in B_i \text{ and } j_i(U) = U \}. \]
We want to show that $F$ is a tower function for $B := \lim_{\eta \to \omega} B_{\eta}$. To see this suppose $\langle U_{i} \mid i < \omega \rangle$ is an illfounded tower with $U_{i} \in B$ for all $i < \omega$, and $f \in L_{\eta}(V_{\lambda+1})$ is such that

$$\forall i(f \upharpoonright i \in F(U_{i})).$$

Let $\langle \alpha_{i} \mid i < \omega \rangle \in L_{\eta}(V_{\lambda+1})$ be such that

$$j_{U_{i},U_{i+1}}(\alpha_{i}) > \alpha_{i+1}.$$ 

For $i < \omega$, let $m_{i}$ be least such that $U_{i} \in B_{n}$ for all $n \geq m_{i}$. Let $(K, \langle k_{i} \mid i < \omega \rangle) \in \mathcal{E}^{e}_{n+1}$ be a 0-close limit root of $J$ such that the following hold:

1. For all $i$, $(k_{0} \circ \cdots \circ k_{i})(F_{0}) = F_{i}$ and $(k_{0} \circ \cdots \circ k_{i})(B_{0}) = B_{i}$.

2. For all $i < \omega$, $\alpha_{i}$, $f(i) \in \text{rng}(K^{\text{ext}})$. Let $\alpha_{i}^{n}$ and $f^{n}(i)$ be such that

$$k_{0}(\alpha_{i}^{0}) = \alpha_{i}, \ k_{1}(\alpha_{i}^{1}) = \alpha_{i}^{0}, \ k_{2}(\alpha_{i}^{2}) = \alpha_{i}^{1}, \ldots$$

and

$$k_{0}(f^{0}(i)) = f(i), \ k_{1}(f^{1}(i)) = f^{0}(i), \ k_{2}(f^{2}(i)) = f^{1}(i), \ldots$$

3. For all $i < n$, $k_{i}(j_{n} \upharpoonright L_{\eta}(V_{\lambda+1})) = j_{i}(j_{n} \upharpoonright L_{\eta}(V_{\lambda+1}))$.

4. For all $n$, let $i_{n}$ be least such that $U_{n} \in \text{rng}((j_{0} \circ \cdots \circ j_{i_{n}-1})(J^{\text{ext}}_{i_{n}}))$. Let $U_{n,i}$ be defined as follows:

$$(j_{0} \circ \cdots \circ j_{i_{n}-1})(j_{i_{n}})(U_{n,0}) = U_{n}, \ (j_{0} \circ \cdots \circ j_{i_{n}-1})(j_{i_{n}+1})(U_{n,1}) = U_{n,0}, \ldots,$$

$$(j_{0} \circ \cdots \circ j_{i_{n}-1})(j_{i_{n}+i+1})(U_{n,i+1}) = U_{n,i}, \ldots$$

Then for $i, n < \omega$ and $m < i_{n}$, there are $U_{n,i}^{m}$ such that

$$k_{0}(U_{n,i}^{0}) = U_{n,i}; \ k_{1}(U_{n,i}^{1}) = U_{n,i}^{0}; \ldots; k_{i_{n}-1}(U_{n,i}^{i_{n}-1}) = U_{n,i}^{i_{n}-2}.$$ 

Furthermore, for $i \geq i_{n}$

$$k_{i}(U_{n,i-i_{n}}^{i_{n}-1}) = j_{i}(U_{n,i-i_{n}}^{i_{n}-1}).$$

It is easy to find such a $(K, \tilde{K})$ using the proof of Lemma 2.1.7.

We have for all $i$ that

$$\alpha_{i} \geq \alpha_{i}^{0} \geq \alpha_{i}^{1} \geq \cdots.$$ 

Let $\alpha_{i}^{\omega}$ be the stable value. For $n < \omega$, by Lemma 4.2.1 $(U_{n,i} \mid i < \omega)$ and $(f^{i} \mid i < \omega)$ must stabilize for some $i$. Let $U_{n,\omega}$ and $f^{\omega}$ be the stable values, defining $U_{n,\omega}^{m}$ in the obvious way.
as above. Note that we have for all \( n, i < \omega \),

\[
(k_0 \circ \cdots \circ k_{i-1})(k_{i+n})(U_{n,i}) = (k_0 \circ \cdots \circ k_{i-1})(k_{i+n})(U_{n,i}^{n-1}) \\
= (k_0 \circ \cdots \circ k_{i-1})(j_{i+n})(U_{n,i}^{n-1}) \\
= (k_0 \circ \cdots \circ k_{i-1})(j_{i+n})(U_{n,i}^{n-1}) \\
= (j_0 \circ \cdots \circ j_{i-1})(U_{n,i}) = U_{n,i-1}
\]

where \( U_{n-1} = U_n \).

We want to show that \( \langle U_{n,n+1}^{n-1} \mid n < \omega \rangle = \langle U_n' \mid n < \omega \rangle \) is an illfounded tower as witnessed by \( \langle \alpha_n^{\omega} \rangle \), and for all \( n < \omega \), \( U_n' \in B_0 \). But also that for all \( n, f^{\omega} \upharpoonright n \in F_0(U_n') \), contradicting the fact that \( F_0 \) is a tower function for \( B_0 \).

The fact that for all \( n, U_n' \in B_0 \) follows since for all large enough \( i, U_n \in B_i \) and \( (k_0 \circ \cdots \circ k_{i-1})(U_n') = U_n \).

To see that \( \langle U_n' \mid n < \omega \rangle \) is illfounded, fix \( n \) and let \( n_0 \) be such that

\[
f \upharpoonright n \in F_{n_0}(U_n)
\]

and for all \( i \geq n_0 \),

\[
(k_0 \circ \cdots \circ k_i)(\alpha_n^{\omega}, \alpha_{n+1}^{\omega}, U_n', U_{n+1}', f^{\omega} \upharpoonright n) = (\alpha_n, \alpha_{n+1}, U_n, U_{n+1}, f \upharpoonright n).
\]

Then we have that

\[
j_{U_n,U_{n+1}}(\alpha_n) > \alpha_{n+1} \Rightarrow j_{U_n',U_{n+1}'}(\alpha_n^{\omega}) > \alpha_{n+1}^{\omega}.
\]

And since \( f \upharpoonright n \in F_{n_0}(U_n) \) we have that \( f^{\omega} \upharpoonright n \in F_0(U_n') \).

Hence we have a contradiction to the fact that \( F_0 \) is a tower function for \( B_0 \). So \( F \) is a tower function for \( B \), and the theorem follows as \( A \subseteq B \).

In fact, since we did not actually use inverse limit reflection, exactly the same proof gives the tower condition for \( L(X, V_{\lambda+1}) \). In this situation we start with assuming an elementary embedding \( j : L(X, V_{\lambda+1}) \rightarrow L(X, V_{\lambda+1}) \), and we make the same definition for a \( U(j) \)-representation and the Tower Condition, replacing each \( L(V_{\lambda+1}) \) with \( L(X, V_{\lambda+1}) \). We then have the following:

**Theorem 4.2.4.** Suppose there exists an elementary embedding

\[
j : L(X, V_{\lambda+1}) \rightarrow L(X, V_{\lambda+1}).
\]

Then the Tower Condition for \( U(j) \) holds in \( L(X, V_{\lambda+1}) \).

Finally by a Theorem of Woodin (see [Woo11]) we have the following:
Corollary 4.2.5. Suppose there exists an elementary embedding
\[ j : L(X, V_{\lambda+1}) \to L(X, V_{\lambda+1}). \]

Let \( Y \) be \( U(j) \)-representable in \( L(X, V_{\lambda+1}) \). Let \( \kappa = \lambda^+ \) and set
\[ \eta = \sup\{ (\kappa^+)_{L[A]} | A \subseteq \lambda \}. \]

Then every set
\[ Z \in L_\eta(Y, V_{\lambda+1}) \cap V_{\lambda+2} \]
is \( U(j) \)-representable in \( L(X, V_{\lambda+1}) \).

4.3 Complexity of fixed point measures

In order to extend the \( U(j) \)-representations past the point given by Corollary 4.2.5 we need to analyze the fixed point measures which compose these representations. We consider a certain game on fixed points which was first considered in [Woo11].

Definition 4.3.1. Suppose \( \gamma < \Theta^{L(V_{\lambda+1})} \) and
\[ \langle a_i | i < \omega \rangle \in (L_\gamma(V_{\lambda+1}))^\omega \]
and we have:
1. \( \gamma \leq \Theta^{L_\gamma(V_{\lambda+1})} \),
2. for all \( i < \omega \), \( a_i \subseteq a_{i+1} \subseteq \gamma \) and \( |a_i| < \lambda \),
3. for all \( i < \omega \), there exists an \( n < \omega \) such that \( j(n)(a_i) = a_i \).

Then let \( G(j, \gamma, \langle a_i | i < \omega \rangle) \) denote the following game. Player I plays a sequence
\[ \langle \langle \gamma_i, \langle b_m^i : m < \omega \rangle : i < \omega \rangle \rangle \]
and player II plays a sequence \( \langle \mathcal{E}_i : i < \omega \rangle \) such that the following hold:
1. \( \mathcal{E}_i \subseteq \text{Emb}(j_i, \gamma_i), |\mathcal{E}_i| \leq \lambda \), and for each \( k \in \mathcal{E}_i \) there exists \( m < \omega \) such that \( k(b_m^i) = b_m^i \).
2. \( \gamma_0 = \gamma, \gamma_{i+1} < \gamma_i \) and there exists \( m < \omega \) such that
\[ k(b_m^i) = b_m^i \Rightarrow k(\gamma_{i+1}) = \gamma_{i+1} \]
for all \( k \in \mathcal{E}_i \).
3. for all \( i < \omega \), \( \gamma_i \leq \Theta^{L_{\gamma_i}(V_{\lambda+1})} \),
CHAPTER 4. U(J)-REPRESENTATIONS

4. \( \langle b^0_m : m < \omega \rangle = \langle a_m : m < \omega \rangle \).

5. for all \( m < \omega \), \( b^i_m \subseteq b^i_{m+1} \subseteq \gamma_i \) and \( |b^i_m| < \lambda \)

6. for all \( m < \omega \) there exists \( m^* < \omega \) such that
   \[
   k(b^i_{m^*}) = b^i_m, \Rightarrow k(b^i_{m+1}) = b^i_{m+1}
   \]
   for all \( k \in \mathcal{E}_i \).

Definition 4.3.2. Suppose \( \gamma < \Theta^L(V_{\lambda+1}), S \subseteq L_\gamma(V_{\lambda+1}) \), and \( \langle a_i | i < \omega \rangle \in (L_\gamma(V_{\lambda+1}))^\omega \) and we have:

1. \( \gamma \leq \Theta^L(V_{\lambda+1}) \),
2. for all \( i < \omega \), \( a_i \subseteq a_{i+1} \subseteq \gamma \) and \( |a_i| < \lambda \),
3. for all \( i < \omega \), there exists an \( n < \omega \) such that \( j(n)(a_i) = a_i \).
4. \( S = \bigcup_{i<\omega} a_i \).

Then we say that \( \langle a_i | i < \omega \rangle \) is a \( j \)-partition of \( S \).

Suppose that \( j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1}) \). Note that for all \( S \subseteq L_\varnothing(V_{\lambda+1}) \cap \text{Ord} \) such that \( |S| \leq \lambda \), there is a \( \gamma < \Theta \) and a \( \langle a_i | i < \omega \rangle \in (L_\gamma(V_{\lambda+1}))^\omega \) such that \( \langle a_i | i < \omega \rangle \) is a \( j \)-partition of \( S \).

Suppose that \( \mathcal{E} \) and \( S \) are such that for all \( \alpha \in S \) there exists an \( i \) such that for all \( k \in \mathcal{E}_i \), \( k(\alpha) = \alpha \). Let \( \vec{a} \) be defined by

\[
\vec{a}_i = \{ \alpha \in S | \forall k \in \mathcal{E}_i (k(\alpha) = \alpha) \}.
\]

We say that \( \vec{a} \) is the partition of \( S \) with respect to \( \mathcal{E} \).

Suppose \( \vec{a} \) is such that \( a_0 \subseteq a_1 \subseteq \cdots \),

\[
a_i \subseteq \{ \alpha \in S | \forall k \in \mathcal{E}_i (k(\alpha) = \alpha) \}
\]

and for all \( i \), \( |a_i| < \text{crit } j(i) \). Then we say that \( \vec{a} \) is a division of \( S \) with respect to \( \mathcal{E} \).

Lemma 4.3.3. Suppose that \( \langle a_i | i < \omega \rangle \) is a \( j \)-partition of \( S \) with \( S \subseteq \gamma \) for some \( \gamma \). Suppose that \( (J, \vec{j}) \in \mathcal{E}_{\eta+1}^e \) is such that \( \eta \geq \gamma \) is good and for all \( i < \omega \),

\[
J_i^{\text{ext} \cdot (i-1)}(a_i) = a_i.
\]

Then there exists a \( (K, \vec{k}) \in \mathcal{E}_{\eta}^e \) a limit root of \( J \) such that for all \( i < \omega \),

\[
K_i^{\text{ext} \cdot (i-1)}(a_i) = a_i.
\]
CHAPTER 4. U(J)-REPRESENTATIONS

Proof. This follows easily in the usual way by noticing that for \( \alpha \) an ordinal, if \( j_i(\alpha) = \alpha \), \( k_i \) is a square root of \( j_i \) and \( \alpha \in \text{rng} k_i \), then \( k_i(\alpha) = \alpha \). Hence if \( \langle a_i | i < \omega \rangle \in \text{rng} k_{n} \) for all \( n < \omega \), then we have that for all \( n < \omega \) that

\[
(j_0 \circ \cdots \circ j_{n-1})^{-1}(a_n) \in \text{rng} \ j_n
\]

and so \( a_n \in \text{rng} j_{n}^{(n)}. \)

**Definition 4.3.4.** Fix \( \kappa < \Theta \) good with \( \text{cof}(\kappa) > \lambda \). Let \( S \subseteq \kappa \) such that \( |S| \leq \lambda \). Then we say that \( S \) is \( \lambda \)-threaded if the following hold:

1. Suppose \( \alpha < \sup S \) is such that there exists \( \bar{\beta} \in S^{<\omega} \) and \( a \in V_\lambda \) such that \( \alpha \) is definable over \( L_\kappa(V_{\lambda+1}) \) from \( \bar{\beta} \) and \( a \). Then \( \alpha \in S \).

2. Suppose \( \alpha \in S \) is a limit and \( \text{cof}(\alpha) < \lambda \). Then \( S \cap \alpha \) is cofinal in \( \alpha \).

We say that \( S \) is definably closed if \( S \) satisfies (1).

Since \( \lambda \)-DC holds in \( L(V_{\lambda+1}) \), we have that for every \( S \subseteq \kappa \) with \( |S| \leq \lambda \), there is \( S' \subseteq \kappa \) with \( S' \supseteq S \) and \( |S'| \leq \lambda \) such that \( S' \) is \( \lambda \)-threaded.

We put for \( E \) a set such that for all \( k \in E, k : L_\alpha(V_{\lambda+1}) \rightarrow L_\alpha(V_{\lambda+1}) \) for some \( \alpha < \Theta \),

\[ \mathcal{F}(E) = \{ \beta | \forall k \in E (k(\beta) = \beta) \}. \]

**Lemma 4.3.5.** Suppose \( \alpha \) is a limit ordinal. Then there exists a \( \gamma < \alpha \) such that for all \( \beta \in [\gamma, \alpha) \) if \( \beta_0 \) is such that \( \beta = \gamma + \beta_0 \), then for all \( \delta < \alpha, \delta + \beta_0 < \alpha \).

**Proof.** We prove this by induction. Suppose that \( \alpha \) is such that there exists a \( \beta < \alpha \) such that for some \( \delta < \alpha, \beta + \delta \geq \alpha \). Let \( \alpha^* \leq \alpha \) be the sup of ordinals \( \gamma < \alpha \) such that for all \( \beta, \delta < \gamma, \delta + \beta < \gamma \). Call the set of such ordinals \( A \). Then clearly \( \alpha^* \in A \). So \( \alpha^* < \alpha \). Let \( \alpha_0 \) be such that \( \alpha^* + \alpha_0 = \alpha \).

We claim that \( \alpha_0 < \alpha \). If not, then \( \alpha^* + \alpha = \alpha \). But then \( \alpha^* \cdot \omega \leq \alpha \), and \( \alpha^* \cdot \omega \in A \), a contradiction.

But then by applying the lemma to \( \alpha_0 \), we have that there exists a \( \gamma < \alpha_0 \) such that for all \( \beta \in [\gamma, \alpha_0) \) if \( \beta_0 \) is such that \( \beta = \gamma + \beta_0 \), then for all \( \delta < \alpha_0, \delta + \beta_0 < \alpha_0 \). But if \( \beta \in [\gamma, \alpha_0) \) then \( \alpha^* + \beta < \alpha \) and for some \( \beta_0 \),

\[ \alpha^* + \beta = \alpha^* + \gamma + \beta_0. \]

Hence \( \gamma_0 = \alpha^* + \gamma \) witnesses the lemma for \( \alpha \). To see this let \( \beta \in [\gamma_0, \alpha) \) and let \( \beta_0 \) be such that \( \alpha^* + \gamma + \beta_0 = \beta \). Suppose \( \delta \in [\alpha^*, \alpha) \). Let \( \delta^* \) be such that \( \alpha^* + \delta^* = \delta \). Then we have that \( \delta^* < \alpha_0 \), and hence \( \delta^* + \beta_0 < \alpha_0 \). But then

\[ \alpha^* + \delta^* + \beta_0 = \delta + \beta_0 < \alpha^* + \alpha_0 = \alpha, \]

which proves the lemma. \( \square \)
From the previous lemma, given a limit ordinal \( \alpha \) there is a unique decomposition,

\[
\alpha = \alpha_0 + \alpha_1 + \cdots + \alpha_n
\]

for some \( n \) with \( \alpha_0 > \alpha_1 > \cdots > \alpha_n \), and such that for all for all \( i < n \), for all

\[
\beta \in [\alpha_0 + \cdots + \alpha_i, \alpha_0 + \cdots + \alpha_{i+1})
\]

if \( \beta_0 \) is such that

\[
\beta = \alpha_0 + \cdots + \alpha_i + \beta_0
\]

then for all \( \delta < \alpha_0 + \cdots + \alpha_{i+1}, \delta + \beta_0 < \alpha_0 + \cdots + \alpha_{i+1} \). We call \( \langle \alpha_0, \ldots, \alpha_n \rangle \) the addition decomposition of \( \alpha \).

We define the function \( c(\alpha, \beta) \) for \( \beta < \alpha \) as follows. Let \( \langle \alpha_0, \ldots, \alpha_n \rangle \) be the addition decomposition of \( \alpha \). Let \( i \) be largest such that \( \alpha_0 + \cdots + \alpha_i \leq \beta \), and let \( \beta_0 \) be such that

\[
\alpha_0 + \cdots + \alpha_i + \beta_0 = \beta.
\]

Set \( c(\alpha, \beta) = \beta_0 \).

Also define the following functions:

\[
l(\alpha) = \alpha_0 + \cdots + \alpha_{n-1}
\]

if \( n > 0 \) and \( l(\alpha) = 0 \) otherwise, where \( \langle \alpha_0, \ldots, \alpha_n \rangle \) is the addition decomposition of \( \alpha \), and

\[
r(\alpha) = \alpha_n.
\]

**Lemma 4.3.6.** Suppose that \( \beta + \gamma = \alpha \). Let \( \langle \alpha_0, \ldots, \alpha_n \rangle \) be the addition decomposition of \( \alpha \). Then for some \( i \), \( \gamma = \alpha_i + \cdots + \alpha_n \).

**Proof.** Note that we have for some \( i \) that \( \beta = \alpha_0 + \cdots + \alpha_{i-1} + \beta' \) and \( \gamma = \gamma' + \alpha_{i+1} + \cdots + \alpha_n \) for some \( \beta' \) and \( \gamma' \) such that \( \beta' + \gamma' = \alpha_i \). Furthermore, if \( \beta \) and \( \gamma \) were a contradiction to the lemma, we would have that \( \beta', \gamma' < \alpha_i \) and \( \beta', \gamma' \neq 0 \). But then \( \beta' + \gamma' < \alpha_i \) by definition of the addition decomposition, a contradiction.

**Lemma 4.3.7.** Suppose that \( \beta + \gamma = \alpha \) and \( \gamma \neq \emptyset \). Then \( r(\gamma) = r(\alpha) \).

**Proof.** By the previous lemma, if \( \langle \alpha_0, \ldots, \alpha_n \rangle \) is the addition decomposition of \( \alpha \), we have that \( \gamma = \alpha_i + \cdots + \alpha_n \) for some \( i \). So it is enough to see that \( \langle \alpha_i, \ldots, \alpha_n \rangle \) is the addition decomposition of \( \gamma \). But this is basically immediate.

We fix a good limit ordinal \( \kappa < \Theta \) for the rest of the section such that \( \kappa \) is regular in \( \mathbb{L}(V_{\lambda+1}) \). Furthermore whenever we refer to \( \bar{J} \) for some inverse limit \( J \), we mean the extension of \( J \) to an embedding \( \bar{J} : \mathbb{L}(V_{\lambda+1}) \to \mathbb{L}(V_{\lambda+1}) \) for some \( \bar{\kappa} \) and \( \bar{\lambda} \).

We first consider a more restrictive version of the above game. This game, in some sense, captures a version of \( \mathcal{G}(j, \gamma(\langle a_i \mid i < \omega \rangle)) \) where only the ‘local largeness’ of the \( \gamma_i \) matter. Later on when we play \( \mathcal{G}(j, \gamma(\langle a_i \mid i < \omega \rangle)) \), we will do so by playing many versions of this more restrictive game.
Lemma 4.3.8. Suppose that \( \alpha_0 < \kappa \) is an ordinal with \( \text{cof}(\alpha_0) > \lambda \) and \((J^0, \vec{j}^0) \in \mathcal{E}_{\kappa + \alpha_0 + 2}\) and \( \alpha_0 \in \text{rng} \hat{J}^0 \). Then II has a quasi-winning strategy in the following game \( G(\alpha_0, J^0) \)

\[
\begin{array}{cccc}
I & \beta_0, \gamma_0 & \beta_1, \gamma_1 & \ldots \\
II & \alpha_1, (J^1, \vec{j}^1) & \alpha_2, (J^2, \vec{j}^2) & \ldots \\
\end{array}
\]

which has the following rules.

1. For all \( i, \alpha_i, \beta_i, \gamma_i < \kappa \).
2. \( \beta_0 > \beta_1 > \beta_2 > \cdots \) and \( \alpha_0 > \alpha_1 > \alpha_2 > \cdots \).
3. \( \alpha_0 > \beta_0 \).
4. For all \( i \), if \( \text{cof}(\beta_i) > \lambda \) then \( \text{cof}(\alpha_{i+1}) > \lambda \).
5. For all \( i \), \((J^i, \vec{j}^i) \in \mathcal{E}_{\kappa + \alpha_i + 2}\) and \( \alpha_i \in \text{rng} \hat{J}^i \).
6. For all \( i \), \( \gamma_i \in (\text{ld}(\alpha_i), \alpha_i) \), \((J^i)\text{ext}(\gamma_i) = \gamma_i \) and \( \alpha_{i+1} \geq \gamma_i \).
7. For all \( i \), \( \alpha_{i+1} \) is definable over \( L_{\kappa + \alpha_i + 2}(V_{\lambda+1}) \) from parameters in

\[
\{ \alpha_0, \ldots, \alpha_i \} \cup \{ \gamma_i \} \cup \lambda,
\]

and \((J^{i+1})\text{ext}(\alpha_{i+1}) = \alpha_{i+1} \).
8. For all \( i \), \( \beta_{i+1} > \text{ld}(\beta_i) \) and \( \beta_i > \text{ld}(\alpha_0) \).

The first player to violate one of the rules loses.

Proof. We describe a quasi-winning strategy for II. First suppose that I plays \( \beta_0 \). Let

\[
K^0 \in \mathcal{E}_{\kappa + \alpha_0 + 1}
\]

be a 0-close limit root of \( J^0 \) such that \( \beta_0 \in \text{rng} \hat{K}^0 \), \((K^0)\text{ext}(\gamma_0) = \gamma_0 \), and

\[
\hat{J}^0(\bar{\alpha}_0) = \alpha_0 = \hat{K}^0(\bar{\alpha}_0)
\]

for some \( \bar{\alpha}_0 \). Let \( \bar{\beta}_0 \) be such that \( \hat{K}^0(\bar{\beta}_0) = \beta_0 \). Now we have by elementarity that \( \text{ld}(\bar{\alpha}_0) < \bar{\beta}_0 \).

So let \( \tilde{\beta}_0^* \) be such that

\[
\text{ld}(\bar{\alpha}_0) + \tilde{\beta}_0^* = \bar{\beta}_0.
\]

Let \( \bar{\beta}_0^* \) be the least \( \beta \) such that there exists \((K, \vec{k}) \in \mathcal{E}_{\kappa + \alpha_0 + 1}\) with

\[
\bar{\lambda}_K < \bar{\beta}_0^*, \quad \hat{K}(\bar{\beta}_0^*) = \beta, \quad \hat{K}^0(\beta) = \beta, \quad \text{and} \quad \hat{K}^0(\gamma_0) = \gamma_0.
\]
Figure 4.1: Typical play of $G(\alpha_0, J^0)$. 
Let \( \alpha_1 = \gamma_0 + \beta_0^- \). Clearly we have that \( \alpha_1 \) is definable over \( L_{\kappa + \alpha_0 + 2}(V_{\lambda + 1}) \) from \( \gamma_0 \) and \( \beta_0^- \). Furthermore we have that \( \alpha_1 < \alpha_0 \) since \( \beta_0^- \leq \hat{K}^0(\beta_0^*) \), and for all \( \delta < \alpha_0 \),

\[
\delta + \hat{K}^0(\beta_0^*) < \alpha_0.
\]

To see that \( \beta_0^- \leq \hat{K}^0(\beta_0^*) \), note that

\[
\beta_0^- \leq (K^\text{ext})^{-1}(\hat{K}^0(\beta_0^*))
\]

since for large enough \( i \), \( K_i^0 \) is a witness to this.

Let \((J^1, \hat{J}) \in E_{\kappa + \alpha_0 + 1} \) be such that \( \tilde{\lambda}_{J^1} < \beta_0^* \), \( \hat{J}(\beta_0^*) = \beta_0^- \), \( (J^1)^\text{ext}(\beta_0^-) = \beta_0^- \) and \((J^1)^\text{ext}(\gamma_0) = \gamma_0 \). Then clearly \((J^1)^\text{ext}(\alpha_1) = \alpha_1 \). Also, if \( \text{cof}(\beta_0) > \lambda \), then \( \text{cof}(\beta_0^*) > \lambda_{J^1} \) and hence \( \text{cof}(\alpha_1) > \lambda \).

Now suppose that I has played \( \beta_0, \ldots, \beta_i \) and \( \gamma_0, \ldots, \gamma_i \) satisfying the rules and II has responded with \( \alpha_1, \ldots, \alpha_i \) and \((J^1, \hat{J}), \ldots, (J^i, \hat{J}) \) satisfying the rules. Also assume that II has chosen \( \beta_0, \ldots, \beta_i, \beta_{i+1} \) and \( K^0, \ldots, K^{i-1} \) satisfying that for all \( n < i \), \( K^n(\beta_n) = \beta_n \) and \( J^{n+1}(\beta_n^*) = \beta_n^- \) where \( \beta_n^- \) is such that \( \gamma_n + \beta_n^- = \alpha_{n+1} \).

Let \((K^i, \hat{K}) \in E_{\kappa + \alpha_i + 1} \) be such that for some \( \beta_i \)

\[
\hat{K}^i(\beta_i) = \beta_i, \quad \hat{K}^i(\beta_{i-1}) = \beta_{i-1}, \quad \text{and} \quad \hat{K}^i(\beta_{i-1}^*) = \beta_{i-1}^*;
\]

and

\[
(K^i)^\text{ext}(\gamma_i, \alpha_{i-1}, \beta_{i-1}^-) = (\gamma_i, \alpha_{i-1}, \beta_{i-1}^-).
\]

Now we have \( \text{ld}(\beta_{i-1}) < \beta_i \). So let \( \beta_i^* \) be such that \( \text{ld}(\beta_{i-1}) + \beta_i^* = \beta_i \).

Let \( \beta_i^- \) be the least \( \beta \) such that there exists \((K, \hat{K}) \in E_{\kappa + \alpha_i + 1} \) with

\[
\tilde{\lambda}_K < \beta_i^*, \quad \hat{K}(\beta_i^*) = \beta, \quad K^\text{ext}(\beta) = \beta, \quad \text{and} \quad K^\text{ext}(\gamma_i) = \gamma_i.
\]

Let \( \alpha_{i+1} = \gamma_i + \beta_i^- \). Clearly we have that \( \alpha_{i+1} \) is definable over \( L_{\kappa + \alpha_i + 2}(V_{\lambda+1}) \) from \( \gamma_i \) and \( \beta_i^* \). Furthermore we have that \( \alpha_{i+1} < \alpha_i \) since

\[
\beta_i^- \leq \hat{K}^i(\beta_i^*),
\]

and \( \beta_i^- = \gamma + \beta_i^- \) for some \( \gamma \) implies by Lemmas 4.3.6 and 4.3.7 that

\[
\text{rd}(\beta_{i-1}^-) = \text{rd}(\beta_{i-1}) > \beta_i^*.
\]

by definition of \( \beta_i^* \) and the fact that \( \beta_i > \beta_{i-1} \). But applying \( \hat{K}^i \) we get that

\[
\text{rd}(\beta_{i-1}^-) > \hat{K}^i(\beta_i^*) \geq \beta_i^-;
\]

which is enough to show that

\[
\alpha_{i+1} = \gamma_i + \beta_i^- < \alpha_i = \gamma_{i-1} + \beta_{i-1}^-.
\]
To see that $\beta_i^- \leq \hat{K}^i(\bar{\beta}_i^*)$, note that

$$\beta_i^- \leq (K^i)^{\text{ext}} \left( (\hat{K}^i(\bar{\beta}_i^*)) \right)$$

since for large enough $m$, $K^i_m$ is a witness to this.

Let $(J^{i+1}, \bar{J}^{i+1}) \in \mathcal{E}_{\kappa + \alpha_{i+1}}$ be such that $\lambda_{J^{i+1}} < \bar{\beta}_i^*$, $\bar{J}^{i+1}(\bar{\beta}_i^*) = \beta_i^-$, $(J^{i+1})^{\text{ext}}(\bar{\beta}_i^-) = \beta_i^-$ and $(J^{i+1})^{\text{ext}}(\gamma_i) = \gamma_i$. Then clearly $(J^{i+1})^{\text{ext}}(\alpha_{i+1}) = \alpha_{i+1}$. Also, if $\text{cof}(\beta_i) > \lambda$, then $\text{cof}(\bar{\beta}_i^*) > \lambda_{J^{i+1}}$ and hence $\text{cof}(\alpha_{i+1}) > \lambda$.

We have described a quasi-winning for II, which proves the lemma. \qed

**Theorem 4.3.9.** Let $j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$ be elementary. Fix $\kappa < \Theta$ good and regular in $L(V_{\lambda+1})$. Suppose that $S$ has a largest element $\alpha_0$, $S$ is $\lambda$-threaded, and $\langle \alpha_i \mid i < \omega \rangle$ is a $j$-partition of $S$. Then $\text{rank}(j, \kappa + \alpha_0, \bar{a}) \geq \alpha_0$. 

---

Figure 4.2: Strategy for $G(j, \kappa + \alpha_0, \bar{a})$. 

---

CHAPTER 4. $U(J)$-REPRESENTATIONS
Proof. We prove this by induction on \( \alpha_0 \). Clearly, if \( \alpha_0 = \alpha_0' + 1 \) then \( S \cap \alpha_0 \) is \( \lambda \)-threaded and has largest element \( \alpha_0' \), hence the induction is immediate.

Now assume that \( \alpha_0 \) is a limit. There are two cases. Either \( \text{cof}(\alpha) < \lambda \) or \( \text{cof}(\alpha) > \lambda \).

First assume that \( \text{cof}(\alpha_0) < \lambda \). Then there must be a sequence \( \langle \beta_i | i < \text{cof}(\alpha_0) \rangle \) cofinal in \( \alpha_0 \) such that for all \( i < \text{cof}(\alpha_0) \), \( \beta_i \in S \). Hence we have that \( S \cap \beta_i + 1 \) is \( \lambda \)-threaded and has largest element \( \beta_i \). So by induction we have that

\[
\text{rank}(j, \kappa + \beta_i, \langle a_i \cap \beta_i + 1 | i < \omega \rangle) \geq \beta_i.
\]

But then clearly we have that \( \text{rank}(j, \kappa + \alpha_0, \vec{a}) \geq \sup_i \beta_i = \alpha_0 \) since for all \( i < \omega \) we have that for some \( n, \beta_i \in a_n \).

Now assume that \( \text{cof}(\alpha_0) > \lambda \). Based on an arbitrary sequence \( \beta_0 > \beta_1 > \cdots \) with \( \beta_0 < \alpha_0 \) we will choose responses \( \alpha_i \) and \( \vec{a}^i \) which are legal plays against a play by II in \( G(j, \kappa + \alpha_0, \vec{a}) \).

Let \( \beta_0 < \alpha_0 \). Let \( \vec{E}^0 \) be a first play by II in \( G(j, \kappa + \alpha_0, \vec{a}) \) and set \( S_0 = S \).

Let \( (J^0, J^0) \in \mathcal{E}_{\kappa + \alpha_0 + \omega} \) be such that \( \alpha_0 \in \text{rng } J^0 \) and \( (J^0)^{\text{ext}}(\alpha_0) = \alpha_0 \). Let \( T_0 \subseteq \beta_0 + 1 \) be \( \lambda \)-threaded with \( \beta_0 \in T_0 \).

For each \( \beta \in T_0 \setminus \sup S_0 \), we play a version of \( G(\alpha_0, J^0) \) and define \( f(\beta) \) by induction on the order of \( T_0 \setminus \sup S_0 \). We call this game \( G(\alpha_0, J^0)[\beta] \) and let \( \alpha[\beta] \) be a winning response by II to the play \( \beta, f(\beta) \) by I. Let \( i \) be least such that

\[
\alpha_0 \in \bigcap_{n \geq i} \mathcal{F}(\mathcal{E}^0_n).
\]

Assume we have defined \( f(\beta') \) and \( \alpha[\beta'] \) for all \( \beta' \in \beta \cap (T_0 \setminus \sup S_0) \). Let \( \gamma \) be least such that for all \( \beta' \in \beta \cap (T_0 \setminus \sup S_0) \),

\[
\gamma > \alpha[\beta'], \quad \forall n \geq i \left( \gamma \in \mathcal{F}(\mathcal{E}^0_n) \right), \text{ and } \quad (J^0)^{\text{ext}}(\gamma) = \gamma.
\]

Set \( f(\beta) = \gamma \).

Let

\[
S_1 = \{ \alpha[\beta] | \beta \in T_0 \setminus \sup S_0 \} \cup (S_0 \cap \alpha_0)
\]

and let \( \vec{a}^1 \) be a division of \( S_1 \) with respect to \( \mathcal{E}^0 \). Note that for all \( \alpha \in S_1 \setminus \sup(S_0 \cap \alpha_0) \), there exists an \( i \) such that for some \( \gamma \in \bigcap_{n \geq i} \mathcal{F}(\mathcal{E}^0_n) \), as \( \alpha \) is definable from parameters in \( \{ \alpha_0, \gamma \} \cup \lambda \) over \( L_{\kappa + \alpha_0 + 2(V_{\lambda+1})} \). Hence there exists an \( i' \) such that for all \( n \geq i' \), \( \alpha \in \mathcal{F}(\mathcal{E}^0_n) \).

I then plays \( (\vec{a}^1, \alpha[\beta_0]) \).

Now assume that I has played

\[
(\vec{a}, \alpha_0), (\vec{a}^1, \alpha[\beta_0]), \ldots, (\vec{a}^n, \alpha[\beta_0, \ldots, \beta_{n-1}])
\]

against \( \vec{E}^0, \vec{E}^1, \ldots, \vec{E}^{n-1} \) and \( \beta_0 > \beta_1 > \cdots > \beta_{n-1} \). Assume we have defined the following as well.
1. $T_0, \ldots, T_{n-1}$ such that for $i < n$, $T_i \subseteq \beta_i + 1$ is $\lambda$-threaded and $\beta_i \in T_i$. Let

$$T_i^* = T_i \setminus (\sup(T_{i-1} \cap \beta_i)),$$

where $T_{-1} = S_0$.

2. Suppose that $\delta_0 > \cdots > \delta_{m-1}$ is such that $m \leq n$ and the following hold: $\delta_0 \in T_0^*$, and for all $i < m-1$, there is an $i'$ such that $\beta_{i'} = \delta_i$, and $\delta_{i+1} \in T_i^*$. Then

$$G(\alpha_0, J^0)[\delta_0, \ldots, \delta_{m-1}]$$

is an instance of $G(\alpha_0, J^0)$ with

$$f(\delta_0), f(\delta_0, \delta_1), \ldots, f(\delta_0, \ldots, \delta_{m-1})$$

defined and with $\alpha[\delta_0] > \cdots > \alpha[\delta_0, \ldots, \delta_{m-1}]$ a winning response by II against the play

$$(\delta_0, f(\delta_0)), (\delta_1, f(\delta_0, \delta_1)), \ldots, (\delta_{m-1}, f(\delta_0, \ldots, \delta_{m-1})).$$

3. For $W_n$ the set of such tuples $(\delta_0, \ldots, \delta_{m-1})$ the function $f$ is defined on $W$ such that it is order preserving from lexicographically ordered tuples to ordinals. Furthermore for all $(\delta_0, \ldots, \delta_{m-1}) \in W_n$, if $s$ is such that $\delta_{m-1} \in T_n^*$, then there is an $i$ such that for all $n' \geq i$

$$f(\delta_0, \ldots, \delta_{m-1}) \in \mathcal{F}(\mathcal{E}_{n'}^n).$$

Now let $\beta_n < \beta_{n-1}$ and let $\tilde{E}_n$ be a play by II. We can assume without loss of generality that if

$$T_{n-1} \cap [\beta_n, \beta_{n-1}) \neq \emptyset$$

then $\beta_n \in T_{n-1}$.

Suppose first that $\beta_n \notin T_{n-1}$. Let $T_n \subseteq \beta_n + 1$ be $\lambda$-threaded such that $\beta_n \in T_n$ and $T_{n-1} \cap \beta_{n-1} \subseteq T_n$. For each $\delta \in T_n \setminus (\sup T_{n-1} \cap \beta_n)$ we define $f(\beta_{s(0)}, \ldots, \beta_{s(m-1)}, \delta)$ by induction, where $s$ is longest such that for all $i < m-1$, there exists an $i'$ such that $\beta_{s(i)} \in T_{i'}$ but $\beta_{s(i+1)} \notin T_{i'}$ and $s(m-1) = n-1$:

First we know that $\beta_{n-1} \in T_{n-1}$ and it is the least element of $T_{n-1}$ greater than $\beta_n$. Hence $\text{cof}(\beta_{n-1}) > \lambda$ since $T_{n-1}$ is $\lambda$-threaded. Hence by definition of the game $G(\alpha_0, J^0)$,

$$\alpha^* = \alpha[\beta_{s(0)}, \ldots, \beta_{s(m-1)}]$$

is such that $\text{cof}(\alpha^*) > \lambda$. Let $i$ be least such that for all $i' \geq i$, $\alpha^* \in \mathcal{F}(\mathcal{E}_{i'}^n)$. Let $\gamma$ be least in $\bigcap_{i' \geq i} \mathcal{F}(\mathcal{E}_{i'}^n) \cap \alpha^*$ such that for all

$$\delta' \in \delta \cap (T_n \setminus (\sup(T_{n-1} \cap \beta_n)))$$

we have

$$\alpha[\beta_{s(0)}, \ldots, \beta_{s(m-1)}, \delta'] > \gamma.$$
Set $f(s(0), \ldots, s(m - 1), \delta) = \gamma$.

Now let

$$S_n = \{\alpha[\delta_0, \ldots, \delta_{m - 1}] | (\delta_0, \ldots, \delta_{m - 1}) \in \text{dom}(f) \} \cap \alpha_{n-1} \cup (S_{n-1} \cap \alpha_{n-1}).$$

Set

$$\alpha_n = \alpha[\beta_s(0), \ldots, \beta_s(m - 1), \beta_{n}],$$

and let $\bar{a}^n$ be a division of $S_n$ with respect to $\vec{E}^n$. I then plays $(\bar{a}^n, \alpha_n)$.

Now suppose that $\beta_n \in T_{n-1}$. Then we simply let $T_n = T_{n-1} \cap \beta_n + 1$ and we set

$$\alpha_n = \alpha[\delta_0, \ldots, \delta_{m-1}]$$

where $(\delta_0, \ldots, \delta_{m-1}) \in W_n$ is the unique sequence satisfying that $\delta_{m-1} = \beta_n$. We set $S_n = S_{n-1} \cap \alpha_n + 1$ and let $\bar{a}^n$ be a division of $S_n$ with respect to $\vec{E}^n$. I then plays $(\bar{a}^n, \alpha_n)$.

Clearly we have shown legal plays by I based on any finite sequence $\beta_0 > \beta_1 > \cdots$. Hence the induction is complete.

**Corollary 4.3.10.** Suppose there exists an elementary embedding $j : L(V_{\lambda + 1}) \rightarrow L(V_{\lambda + 1})$. Then the supremum of $\text{rank}(j, \kappa, \bar{a})$ for all possible $\kappa$ and $\bar{a}$ is $\Theta$.

### 4.4 Representations in $L(V_{\lambda + 1})$

Using the results of the previous few sections, we can show by a result of Woodin that $U(j)$-representations extend considerably far in $L(V_{\lambda + 1})$. Uncovering the full extent of these representations in $L(V_{\lambda + 1})$ has many interesting consequences which we will explore in the next section.

**Theorem 4.4.1** (Cramer, Woodin). Suppose there is an elementary embedding

$$j : L(V_{\lambda + 1}) \rightarrow L(V_{\lambda + 1}).$$

Let $\kappa$ be least such that

$$J_\kappa(V_{\lambda + 1}) \prec \Sigma_1(V_{\lambda + 1} \cup \{V_{\lambda + 1}\}) J_{\kappa+1}(V_{\lambda + 1}).$$

Then every set $Z \in L_\kappa(V_{\lambda + 1}) \cap V_{\lambda + 2}$ is $U(j)$-representable in $L(V_{\lambda + 1})$.

The following proof, which gives the representations from the Tower Condition and the results of Section 4.3, is due to Woodin.

**Proof sketch.** Let $G^*(j, \gamma, \vec{a})$ be the game defined the same as $G(j, \gamma, \vec{a})$ where in addition one requires that
1. \( \gamma \) is weakly inaccessible in \( L(V_{\lambda+1}) \) and \( L_\gamma(V_{\lambda+1}) < L_\Theta(V_{\lambda+1}) \).

2. For each \( i < \omega \), \( \gamma_i \) is weakly inaccessible in \( L(V_{\lambda+1}) \) and \( L_\gamma(V_{\lambda+1}) < L_\Theta(V_{\lambda+1}) \).

Since the set of \( \gamma < \Theta \) which are weakly inaccessible in \( L(V_{\lambda+1}) \) is cofinal in \( \Theta \), the theorems of the previous section carry over to \( \ast^*(j, \gamma, \bar{a}) \).

Let \( S \) be the set of all \( (\gamma, \bar{a}) \) such that \( \ast^*(j, \gamma, \bar{a}) \) is defined. For each \( (\gamma, \bar{a}) \in S \), let \( N(\gamma, \bar{a}) \) be the set of all \( Z \in L(V_{\lambda+1}) \cap V_{\lambda+2} \) such that \( Z \) is \( \ast(j, \gamma, \bar{a}) \)-representable. Let \( \rho(\gamma, \bar{a}) \) be the least ordinal \( \alpha \) such that

\[
L_{\alpha+1}(V_{\lambda+1}) \cap V_{\lambda+2} \not\subseteq N(\gamma, \bar{a}).
\]

We show that if \( (\gamma, \bar{a}) \in S \) then it is not the case that

\[
\rho(\gamma, \bar{a}) < \text{rank}(\ast^*(\gamma, \bar{a})).
\]

To see this, suppose towards a contradiction that this were the case. Then by replacing \( (\gamma, \bar{a}) \) by a move at some finite stage of \( \ast^*(j, \gamma, \bar{a}) \) by Player I, we can assume that for all initial moves \( E_0 \subseteq \mathcal{E}(j, \gamma) \) there exists a response \( (\gamma_i, b_i) \in S \) such that \( \rho(\gamma_i, b_i) \geq \rho(\gamma, \bar{a}) \).

Let \( \kappa = \rho(\gamma, \bar{a}) \). Suppose that \( a \in L_\gamma(V_{\lambda+1}) \), \( i < \omega \) and \( j(i)(a, \gamma) = (a, \gamma) \). Let \( E_a \) be the set of all \( k \in \mathcal{E}(j, \gamma) \) such that \( k(a) = a \). For each \( \sigma \in [E_a]^\lambda \) let

\[
C_\sigma = \{ b \in L_\gamma(V_{\lambda+1}) \mid k(b) = b \text{ for all } k \in \sigma \},
\]

and let \( \mathcal{F}_a \) be the filter generated by the sets \( C_\sigma \) for \( \sigma \in [E_a]^\lambda \).

As before (see Lemma 4.1.2) we have that there exists a partition \( \langle S_\alpha \mid \alpha < \eta_a \rangle \) of \( \lambda \) into \( \mathcal{F}_a \)-positive sets such that \( \eta_a < \text{crit}(j(i)) \) and for each \( \alpha < \eta_a \), \( \mathcal{F}_a \upharpoonright S_\alpha \) is an ultrafilter in \( L(V_{\lambda+1}) \).

We claim that there exists a set \( E_0 \in [\mathcal{E}(j, \gamma)]^\lambda \) and a function

\[
e : L_\gamma(V_{\lambda+1}) \to U(j, \gamma, \bar{a})
\]

such that the following hold:

1. For each \( k \in E_0 \) there exists \( i < \omega \) such that \( k(a_i) = a_i \).

2. For all \( c \in L_\gamma(V_{\lambda+1}) \), if for all \( i < \omega \), \( k(c_i) = c_i \) for all \( k \in E_0 \) such that \( k(a_i) = a_i \), then \( \langle e(c_i) \mid i < \omega \rangle \) is a wellfounded tower and for all \( i < \omega \), for \( e(c_i) \)-almost all \( c \in L_\gamma(V_{\lambda+1}) \),

\[
(L_\gamma(V_{\lambda+1}), \langle c_n \mid n < i \rangle) \equiv (L_\gamma(V_{\lambda+1}), c)
\]

with parameters in \( V_\lambda \cup \{ V_{\lambda+1} \} \).
This follows immediately by restricting to a measure one set of equivalent elements in the above sense, and then finding \( E_0 \) which generates that set.

Let \( \langle \kappa_i \mid i < \omega \rangle \) be the critical sequence of \( j \). We can assume without loss of generality that \( \kappa_i \in a_i \) for all \( i < \omega \). Let \( N(E_0) \) be the set of all \( Z_0 \subseteq V_{\lambda+1} \) such that there exists a function
\[
\pi_0 : \bigcup \{ V_{\kappa_i+1} \times V_{\kappa_i+1} \times \{ i \} \mid i < \omega \} \to U(j, \gamma_0, \langle a_i \mid i < \omega \rangle)
\]
such that

1. \( \gamma_0 < \gamma \) and \( L_{\gamma_0}(V_{\lambda+1}) \equiv_{\Sigma_2} L_{\gamma}(V_{\lambda+1}) \).
2. \( \gamma_0 \) is weakly inaccessible in \( L(V_{\lambda+1}) \).
3. There exists \( i < \omega \) such that for all \( k \in E_0 \), if \( k(a_i) = a_i \) then \( k(\gamma_0) = \gamma_0 \).
4. \( \pi_0 \) witnesses that \( Z_0 \) is \( U(j, \gamma_0, \vec{a}) \)-representable.
5. For all \( i < \omega \) and \( k \in E_0 \), if \( k(a_i, \gamma_0) = (a_i, \gamma_0) \) then \( k(\pi_0 \upharpoonright V_{\kappa_i+\omega}) = \pi_0 \upharpoonright V_{\kappa_i+\omega} \).

Fix \( c_0 \in V_{\lambda+1} \) and for each formula \( \phi(x_0, x_1) \) let \( Z_\phi \) be the set of all \( a \in V_{\lambda+1} \) such that there exists \( Z \in N(E_0) \) such that
\[
(V_{\lambda+1}, Z) \models \phi[c_0, a].
\]

It can be shown that for all \( \phi \), \( Z_\phi \) is \( U(j, \gamma, \vec{a}) \)-representable. We can then show however that every subset of \( V_{\lambda+1} \) in \( J_{\kappa+1}(V_{\lambda+1}) \) is \( U(j, \gamma, \vec{a}) \)-representable, which is a contradiction to the definition of \( \kappa \) (see [Woo11] for details).

\[
\square
\]

### 4.5 Consequences of \( U(j) \)-representations

In view of the results of the previous sections, we make the following conjecture, which we call the \( U(j) \)-conjecture.

**Conjecture 4.5.1 (\( U(j) \)-conjecture).** Suppose that there exists \( j : L(V_{\lambda+1}) \to L(V_{\lambda+1}) \) elementary. Then in \( L(V_{\lambda+1}) \) every subset of \( V_{\lambda+1} \) is \( U(j) \)-representable.

There are many consequences of the existence of \( U(j) \)-representations. These include structural consequences very similar to the consequences of inverse limit reflection. For instance a perfect set property and the fact that the weak \( \omega \)-club filter is an ultrafilter both follow from \( U(j) \)-representations (see reference). There are stronger consequences of \( U(j) \)-representations, however. An important example is the following theorem of Woodin which gives a version of generic absoluteness.
Theorem 4.5.2 (Woodin). Suppose that \( j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1}) \) is a proper elementary embedding (see [Woo11]), and that \( \beta \) is such that all elements of \( L_\beta(V_{\lambda+1}) \cap V_{\lambda+2} \) are \( U(j) \)-representable. Let \( M_\omega \) be the \( \omega \)-th iterate of \( L(V_{\lambda+1}) \) by \( j \), and let \( j_{0,\omega} : L(V_{\lambda+1}) \rightarrow M_\omega \). Suppose that \( g \in V \), \( g \) is \( M_\omega \)-generic for a partial order \( P \in j_{0,\omega}(V_\lambda) \) and that \( \text{cof}(\lambda) = \omega \) in \( M_\omega[g] \). Then for all \( \alpha < \beta \) there exists an elementary embedding

\[ \pi : L_\alpha(M_\omega[g] \cap V_{\lambda+1}) \rightarrow L_\alpha(V_{\lambda+1}) \]

such that \( \pi \upharpoonright \lambda \) is the identity.

An application of this theorem, using the existence of \( U(j) \)-representations for \( L(V_{\lambda+1}) \) shown above, is the following.

Theorem 4.5.3 (Woodin). Assume the \( U(j) \)-conjecture holds. Then

\[ \text{Con}(I_0) \rightarrow \text{Con}(I_0 \text{ at } \lambda \text{ and } 2^\lambda = \lambda^{++}) \]

The existence of \( U(j) \)-representations also has the important consequence of connecting \( L(V_{\lambda+1}) \) with models of determinacy. In particular we have the following.

Theorem 4.5.4 (Woodin). Suppose that there exists an elementary embedding

\[ j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1}) \]

where \( \lambda \) is a limit of supercompact cardinals and there is a proper class of Woodin cardinals. Assume the \( U(j) \)-conjecture holds. Then there is an inner model which satisfies \( AD^+ \) and \( \exists \alpha (\Theta_\alpha \text{ is the largest Suslin cardinal}) \).

Interestingly, if the \( U(j) \)-conjecture holds, then there can be no direct connection between uniformization and these representations, as uniformization does not hold for every set in \( L(V_{\lambda+1}) \). To see this, recall the following fact, whose proof is the same as in the case of \( L(R) \).

Fact 4.5.5 (Kechris and Solovay). There is a subset of \( V_{\lambda+1}, R \in L(V_{\lambda+1}), \Pi_1(V_{\lambda+1}) \)-definable over \( L(V_{\lambda+1}) \) such that \( R \) does not have a uniformization in \( L(V_{\lambda+1}) \).

Proof. Let \( R \) be the set

\[ R = \{(x, y) \in V_{\lambda+1} \times V_{\lambda+1} \mid y \text{ is not OD from } x \text{ in } L(V_{\lambda+1})\} \]

Suppose that \( U \) is a uniformization of \( R \) such that \( U \in L(V_{\lambda+1}) \). Then \( U \) is OD from some \( x \in V_{\lambda+1} \) in \( L(V_{\lambda+1}) \). But then if \( y \) is such that \( (x, y) \in U \), then \( y \) is OD from \( x \) in \( L(V_{\lambda+1}) \), a contradiction to the definition of \( R \). \( \square \)
Chapter 5

Conclusion

5.1 Future directions

5.1.1 The $E_0^\alpha$ hierarchy

One important direction for future research is to what extent the above results can be extended beyond $L(V_{\lambda+1})$ to stronger large cardinals. A related question is, what are the extensions beyond $L(V_{\lambda+1})$? A variety of possible extensions have been proposed, and in some sense the extension of inverse limit reflection and $U(j)$-representations to these structures would give them something of a justification, especially in light of the failure of a general inverse limit $X$-reflection.

In this section we introduce an extension above $L(V_{\lambda+1})$ introduced by Woodin, which was motivated by construction of the minimal model of $AD_R$.

Definition 5.1.1. Let $\langle E_0^\alpha(V_{\lambda+1}) | \alpha < \Upsilon_{V_{\lambda+1}} \rangle$ be the maximum sequence such that the following hold.

1. $E_0^0(V_{\lambda+1}) = L(V_{\lambda+1}) \cap V_{\lambda+2}$ and $E_1^0(V_{\lambda+1}) = L((V_{\lambda+1})^\#) \cap V_{\lambda+2}$.

2. Suppose $\alpha < \Upsilon_{V_{\lambda+1}}$ is a limit ordinal. Then

\[ E_0^\alpha(V_{\lambda+1}) = L(\bigcup \{E_0^\beta(V_{\lambda+1}) | \beta < \alpha\}) \cap V_{\lambda+2}. \]

3. Suppose $\alpha + 1 < \Upsilon_{V_{\lambda+1}}$. Then for some $X \in E_0^\alpha(V_{\lambda+1})$, there exists a surjection $f : V_{\lambda+1} \to E_0^\alpha(V_{\lambda+1})$ such that $f \in L(X, V_{\lambda+1})$ and

\[ E_0^{\alpha+1}(V_{\lambda+1}) = L(X, V_{\lambda+1}) \cap V_{\lambda+2}, \]

and if $\alpha + 2 < \Upsilon_{V_{\lambda+1}}$ then

\[ E_0^{\alpha+2}(V_{\lambda+1}) = L((X, V_{\lambda+1})^\#) \cap V_{\lambda+2}. \]
4. Suppose \( \alpha < \Upsilon_{V_{\lambda+1}} \). Then there exists \( X \subseteq V_{\lambda+1} \) such that \( E_0^\alpha V_{\lambda+1} \subseteq L(X, V_{\lambda+1}) \) and such that there is a proper elementary embedding

\[ j : L(X, V_{\lambda+1}) \rightarrow L(X, V_{\lambda+1}). \]

5. Suppose that \( \alpha < \Upsilon_{V_{\lambda+1}} \) is a limit ordinal and \( N = E_0^\alpha(V_{\lambda+1}) \). Then either

   (a) \( (\text{cof}(\Theta^N))^{L(N)} < \lambda \), or
   (b) \( (\text{cof}(\Theta^N))^{L(N)} > \lambda \) and for some \( Z \in N \), \( L(N) = (\text{HOD}_{V_{\lambda+1}})_{L(N)} \).

6. Suppose that \( \alpha + 1 < \Upsilon_{V_{\lambda+1}} \) is a limit ordinal and \( N = E_0^\alpha(V_{\lambda+1}) \). Then either

   (a) \( (\text{cof}(\Theta^N))^{L(N)} < \lambda \) and \( E_0^{\alpha+1}(V_{\lambda+1}) = L(N^\lambda, N) \cap V_{\lambda+2} \), or
   (b) \( (\text{cof}(\Theta^N))^{L(N)} > \lambda \) and \( E_0^{\alpha+1}(V_{\lambda+1}) = L(E(N), N) \cap V_{\lambda+2} \), where

\[ E(N) = \{ j : j : N \rightarrow N \text{ is elementary} \}. \]

**Question 5.1.2.** Does inverse limit reflection hold in the \( E_0^\alpha \) hierarchy? Which sets in the \( E_0^\alpha \)-hierarchy are \( U(j) \)-representable?

### 5.1.2 Reinhardt cardinals

A fundamental question in the theory of large cardinals is whether or not it is consistent for there to be an elementary embedding \( V \rightarrow V \) without assuming the axiom of choice. We consider here a weaker question which could be more readily answered.

**Question 5.1.3.** Is it consistent for there to be an elementary embedding \( j : V \rightarrow V \) such that for \( \lambda \) the limit of the critical sequence of \( j \), \( \lambda \)-DC holds and \( \lambda \) is a limit of supercompacts?

We outline some motivation that the such cardinals are indeed inconsistent. To do this we introduce the following notion of Woodin.

**Definition 5.1.4 (Woodin).** We call the following statement the *Weak Uniqueness of Square Roots at \( \lambda \)*. Suppose \( \lambda \) is a limit of supercompact cardinals. For all \( X \subseteq V_{\lambda+1} \), if

\[ j : L(X, V_{\lambda+1}) \rightarrow L(X, V_{\lambda+1}) \]

is a proper elementary embedding such that \( j(X) \in L_\omega(X, V_{\lambda+1}) \), and if \( k_1 \) and \( k_2 \) are each square roots of \( j \) such that

1. \( k_1 \upharpoonright V_\lambda = k_2 \upharpoonright V_\lambda \),
2. \( k_1(L_\omega(X, V_{\lambda+1})) = k_2(L_\omega(X, V_{\lambda+1})) = L_\omega(X, V_{\lambda+1}) \),

then \( k_1 \upharpoonright \Theta^{L(X, V_{\lambda+1})} = k_2 \upharpoonright \Theta^{L(X, V_{\lambda+1})} \).
Theorem 5.1.5 (Woodin). Suppose that ZFC implies that the weak uniqueness of square roots holds. Then under ZF, assuming there is a proper class of supercompact cardinals, there is no elementary embedding $j : V \rightarrow V$ such that $\text{crit}(j)$ is a limit of supercompact cardinals.

Lemma 5.1.6 (Woodin). Suppose $X \subseteq V_{\lambda+1}$, $j : L(X, V_{\lambda+1}) \rightarrow L(X, V_{\lambda+1})$ is a proper elementary embedding such that $j(X) \in L_{\omega}(X, V_{\lambda+1})$. Let $\Theta = \Theta^{L(X, V_{\lambda+1})}$ and suppose that for each $\eta < \Theta$, there exists a surjection $\rho : V_{\lambda+1} \rightarrow \eta$ such that $\rho$ is $\Sigma_1$-definable in $(L_{\Theta}(X, V_{\lambda+1}), j \upharpoonright L_{\Theta}(X, V_{\lambda+1}))$ with parameters from $V_{\lambda+1} \cup \Theta \cup \{L_{\omega}(X, V_{\lambda+1})\}$. Then the weak uniqueness of square roots holds for $(X, j)$ at $\lambda$.

The connection here is the following question about $L(V_{\lambda+1})$.

Question 5.1.7. Suppose $j : L(V_{\lambda+1}) \rightarrow L(V_{\lambda+1})$ is elementary. Then is $V_{\lambda+1}^# \in L(j \upharpoonright L_{\Theta}(V_{\lambda+1}), V_{\lambda+1})$?

In fact do we have

$L(j \upharpoonright L_{\Theta}(V_{\lambda+1}), V_{\lambda+1}) \cap V_{\lambda+2} \neq L(V_{\lambda+1}) \cap V_{\lambda+2}$?

If we could answer this question in the affirmative, then a similar analysis throughout the $E^0_\alpha$ hierarchy could be a way of showing that certain $V \rightarrow V$ embeddings do not exist without using the Axiom of Choice.
