# ON VALUES ASSOCIATED WITH A STOCHASTIC SEQUENCE 

Y. S. CHOW ${ }^{1}$<br>Purdue University<br>and<br>H. ROBBINS ${ }^{2}$<br>Columbia University

## 1. Introduction

Let $\left\{z_{n}\right\}_{1}^{\infty}$ be a sequence of random variables with a known joint distribution. We are allowed to observe the $z_{n}$ sequentially, stopping anywhere we please; the decision to stop with $z_{n}$ must be a function of $z_{1}, \cdots, z_{n}$ only (and not of $z_{n+1}, \cdots$ ). If we decide to stop with $z_{n}$, we are to receive a reward $x_{n}=$ $f_{n}\left(z_{1}, \cdots, z_{n}\right)$ where $f_{n}$ is a known function for each $n$. Let $t$ denote any rule which tells us when to stop and for which $E\left(x_{t}\right)$ exists, and let $v$ denote the supremum of $E\left(x_{t}\right)$ over all such $t$. How can we find the value of $v$, and what stopping rule will achieve $v$ or come close to it?

## 2. Definition of the $\boldsymbol{\gamma}_{\boldsymbol{n}}$ sequence

We proceed to give a more precise definition of $v$ and associated concepts. We assume given always
(a) a probability space $(\Omega, \mathfrak{F}, P)$ with points $\omega$;
(b) a nondecreasing sequence $\left\{\mathfrak{F}_{n}\right\}_{1}^{\infty}$ of sub-Borel fields of $\mathfrak{F}$;
(c) a sequence $\left\{x_{n}\right\}_{1}^{\infty}$ of random variables $x_{n}=x_{n}(\omega)$ such that for each $n \geq 1, x_{n}$ is measurable $\left(\mathscr{F}_{n}\right)$ and $E\left(x_{n}^{-}\right)<\infty$.
(In terms of the intuitive background of the first paragraph, $\mathcal{F}_{n}$ is the Borel field $₫\left(z_{1}, \cdots, z_{n}\right)$ generated by $z_{1}, \cdots, z_{n}$. Having served the purpose of defining the $\mathscr{F}_{n}$ and $x_{n}$, the $z_{n}$ disappear in the general theory which follows.) Any random variable (r.v.) $t$ with values $1,2, \cdots$ (not including $\infty$ ) such that the event $[t=n]$ (that is, the set of all $\omega$ such that $t(\omega)=n$ ) belongs to $\mathscr{F}_{n}$ for each $n \geq 1$, is called a stopping variable (s.v.); $x_{t}=x_{t(\omega)}(\omega)$ is then a r.v. Let $C$ denote the class of all $t$ for which $E\left(x_{t}^{-}\right)<\infty$. We define the value of the stochastic sequence $\left\{x_{n}, \mathcal{F}_{n}\right\}_{1}^{\infty}$ to be

[^0]\[

$$
\begin{equation*}
v=\sup _{t \in C} E\left(x_{t}\right) \tag{1}
\end{equation*}
$$

\]

Similarly, for each $n \geq 1$ we denote by $C_{n}$ the class of all $t$ in $C$ such that $P[t \geq n]=1$, and set

$$
\begin{equation*}
v_{n}=\sup _{t \in C_{n}} E\left(x_{t}\right) . \tag{2}
\end{equation*}
$$

Then

$$
\begin{equation*}
C=C_{1} \supset C_{2} \supset \cdots \quad \text { and } \quad v=v_{1} \geq v_{2} \geq \cdots ; \tag{3}
\end{equation*}
$$

since $t=n \in C_{n}$, we have $v_{n} \geq E\left(x_{n}\right)>-\infty$.
For any family $\left(y_{t}, t \in T\right)$ of r.v.'s we define $y=\operatorname{ess}^{\sup }{ }_{t \in T} y_{t}$ if (a) $y$ is a r.v. such that $P\left[y \geq y_{t}\right]=1$ for each $t$ in $T$, and (b) if $z$ is any r.v. such that $P\left[z \geq y_{t}\right]=1$ for each $t$ in $T$, then $P[z \geq y]=1$. It is known that there always exists a sequence $\left\{t_{k}\right\}_{1}^{\infty}$ in $T$ such that

$$
\begin{equation*}
\sup _{k} y_{t_{k}}=\underset{t \in T}{\operatorname{ess} \sup } y_{t} \tag{4}
\end{equation*}
$$

We may therefore define for each $n \geq 1$ a r.v. $\gamma_{n}$ measurable ( $\mathcal{F}_{n}$ ) by

$$
\begin{equation*}
\gamma_{n}=\underset{t \in C_{n}}{\operatorname{ess} \sup _{n}} E\left(x_{t} \mid \mathfrak{F}_{n}\right) \tag{5}
\end{equation*}
$$

then $\gamma_{n} \geq x_{n}$ (equalities and inequalities are understood to hold up to sets of $P$-measure 0 ) and $E\left(\gamma_{n}^{-}\right) \leq E\left(x_{n}^{-}\right)<\infty$.

It might seem more natural to consider, instead of $C_{n}$, the larger class $\tilde{C}_{n}$ of all s.v.'s $t$ such that $P[t \geq n]=1$ and $E\left(x_{t}\right)$ exists, that is $E\left(x_{t}^{-}\right)$and $E\left(x_{t}^{+}\right)$ not both infinite. However, this would yield the same $v_{n}$ and $\gamma_{n}$. For if $t \in \widetilde{C}_{n}$, define

$$
t^{\prime}=\left\{\begin{array}{l}
t \text { if } E\left(x_{t} \mid \mathcal{F}_{n}\right) \geq x_{n}  \tag{6}\\
n \text { otherwise }
\end{array}\right.
$$

Then setting $A=\left[E\left(x_{t} \mid \mathfrak{F}_{n}\right) \geq x_{n}\right]$, we have

$$
\begin{equation*}
E\left(x_{i^{\prime}}^{-}\right) \leq E\left(x_{n}^{-}\right)+\int_{A} x_{t}^{-} \tag{7}
\end{equation*}
$$

But $-\infty<\int_{A} x_{n} \leq \int_{A} x_{t}$, so $\int_{A} x_{t}^{-}<\infty$. Hence, $E\left(x_{t^{\prime}}^{-}\right)<\infty$ and $t^{\prime} \in C_{n}$. Now $E\left(x_{t^{\prime}} \mid \mathcal{F}_{n}\right)=\max \left(x_{n}, E\left(x_{t} \mid \mathfrak{F}_{n}\right)\right) \geq E\left(x_{t} \mid \mathfrak{F}_{n}\right)$, and hence $E\left(x_{t^{\prime}}\right) \geq E\left(x_{t}\right)$. It follows that $v_{n}$ and $\gamma_{n}$ are unchanged if we replace $C_{n}$ by $\widetilde{C}_{n}$ in their definitions.

## 3. Some lemmas

Lemma 1. For each $n \geq 1$ there exists a sequence $\left\{t_{k}\right\}_{1}^{\infty}$ in $C_{n}$ such that

$$
\begin{equation*}
x_{n} \leq E\left(x_{t_{k}} \mid F_{n}\right) \uparrow \gamma_{n} \quad \text { as } \quad k \rightarrow \infty \tag{8}
\end{equation*}
$$

Proof. Choose $\left\{t_{k}\right\}_{1}^{\infty}$ in $C_{n}$ with $t_{1}=n$ such that $\gamma_{n}=\sup _{k} E\left(x_{t_{k}} \mid F_{n}\right)$. By lemmas 2 and 3 below, we can assume that (8) holds.

Lemma 2. For any $t \in C_{n}$, define $t^{\prime}=$ first $k \geq n$ such that $E\left(x_{t} \mid \mathfrak{F}_{k}\right) \leq x_{k}$. Then
(a) $t^{\prime} \leq t, t^{\prime} \in C_{n}$,
(b) $E\left(x_{t^{\prime}} \mid \mathfrak{F}_{n}\right) \geq E\left(x_{t} \mid \mathfrak{F}_{n}\right)$,
(c) $t^{\prime}>j \geq n \Rightarrow E\left(x_{t^{\prime}} \mathfrak{F}_{j}\right)>x_{j}$.

Proof. If $t=j \geq n$, then $E\left(x_{t} \mid \mathfrak{F}_{j}\right)=x_{j}$, so $t^{\prime} \leq j$; hence, $t^{\prime} \leq t$. Now

$$
\begin{align*}
E\left(x_{i^{\prime}}^{-}\right) & =\sum_{k=n}^{\infty} \int_{\left[t^{\prime}=k\right]} x_{k}^{-} \leq \sum_{k=n}^{\infty} \int_{\left[t^{\prime}=k\right]} E^{-}\left(x_{t} \mid \mathfrak{F}_{k}\right) \leq \sum_{k=n}^{\infty} \int_{\left[t^{\prime}=k\right]} E\left(x_{t}^{-} \mid \mathfrak{F}_{k}\right)  \tag{9}\\
& =E\left(x_{t}^{-}\right)<\infty
\end{align*}
$$

so that $t^{\prime} \in C_{n}$. Hence (a) holds. For any $A \in \mathfrak{F}_{j}$ with $j \geq n$,

$$
\begin{equation*}
\int_{A\left[t^{\prime} \geq j\right]} x_{t^{\prime}}=\sum_{k=j}^{\infty} \int_{A\left[t^{\prime}=k\right]} x_{k} \geq \sum_{k=j}^{\infty} \int_{A\left[t^{\prime}=k\right]} E\left(x_{t} \mid \mathfrak{F}_{k}\right)=\int_{A\left[t^{\prime} \geq j\right]} x_{t} . \tag{10}
\end{equation*}
$$

Putting $j=n$ gives (b). For $t^{\prime}>j$ we obtain $E\left(x_{t^{\prime}} \mid \mathcal{F}_{j}\right) \geq E\left(x_{t} \mid \mathfrak{F}_{j}\right)>x_{j}$, which gives (c).

Any $t^{\prime} \in C_{n}$ satisfying (c) of lemma 2 will be called $n$-regular.
Lemma 3. Let $\left\{t_{i}\right\}_{1}^{\infty} \in C_{n}$ be $n$-regular for some fixed $n \geq 1$, and define $\tau_{i}=$ $\max \left(t_{1}, \cdots, t_{i}\right)$. Then $\tau_{i} \in C_{n}$ is n-regular and

$$
\begin{equation*}
\max _{1 \leq k \leq i} E\left(x_{t k} \mid F_{n}\right) \leq E\left(x_{\tau_{i} \mid} \mid \mathfrak{F}_{n}\right) \leq E\left(x_{\tau_{i+1} \mid} \mid \mathfrak{F}_{n}\right) \tag{11}
\end{equation*}
$$

Proof. That $\tau_{i} \in C_{n}$ is clear. For $j \geq n$ and $A \in \mathscr{F}_{j}$,

$$
\begin{align*}
\int_{A\left[\tau_{i} \geq j\right]} x_{r_{i}} & =\sum_{k=j}^{\infty}\left(\int_{A\left[\tau_{i}=k \geq t_{i+1}\right]} x_{\pi_{i+1}}+\int_{A\left[\tau_{i}=k<t_{i+1}\right]} x_{k}\right)  \tag{12}\\
& \leq \sum_{k=j}^{\infty}\left(\int_{A\left[\tau_{i}=k \geq t_{i+1}\right]} x_{\tau_{i+1}}+\int_{A\left[\tau_{i}=k<t_{i+1}\right]} x_{t_{i+1}}\right) \\
& =\int_{A\left[r_{i} \geq j\right]} x_{\tau_{i+1} .}
\end{align*}
$$

For $j=n$, this gives

$$
\begin{equation*}
E\left(x_{\pi_{i+1}+} \mid \mathfrak{F}_{n}\right) \geq E\left(x_{\tau_{i} \mid} \mid \mathfrak{F}_{n}\right) \geq \cdots \geq E\left(x_{\pi \mid} \mid \mathfrak{F}_{n}\right)=E\left(x_{t i} \mid \mathfrak{F}_{n}\right) \tag{13}
\end{equation*}
$$

and hence, by symmetry,

$$
\begin{equation*}
E\left(x_{\tau_{i} \mid} \mid \mathcal{F}_{n}\right) \geq \max _{1 \leq k \leq i} E\left(x_{t k} \mid F_{n}\right) \tag{14}
\end{equation*}
$$

To prove that $\tau_{i}$ is $n$-regular, we observe by the above that

$$
\begin{equation*}
\tau_{i} \geq j \Rightarrow E\left(x_{\tau_{i}} \mid \mathfrak{F}_{j}\right) \leq E\left(x_{\tau_{i+1} \mid} \mid \mathfrak{F}_{j}\right) \tag{15}
\end{equation*}
$$

Since $t_{1}$ is $n$-regular,

$$
\begin{equation*}
t_{1}<j \Rightarrow x_{j}<E\left(x_{t i} \mid \mathfrak{F}_{j}\right)=E\left(x_{\pi} \mid \mathfrak{F}_{j}\right) \leq \cdots \leq E\left(x_{\tau_{i} \mid} \mid F_{j}\right) \tag{16}
\end{equation*}
$$

and by symmetry,

$$
\begin{equation*}
\boldsymbol{\tau}_{i}>j \Rightarrow x_{j}<E\left(x_{\pi_{i}} \mid \mathfrak{F}_{j}\right) . \tag{17}
\end{equation*}
$$

## 4. The fundamental theorem

Theorem 1. The following relations hold:

$$
\begin{align*}
& \text { (a) } \gamma_{n}=\max \left(x_{n}, E\left(\gamma_{n+1} \mid \mathfrak{F}_{n}\right)\right), \\
& \text { (b) } E\left(\gamma_{n}\right)=v_{n}
\end{align*}
$$

Proof. (a). Given any $t \in C_{n}$, let $t^{\prime}=\max (t, n+1) \in C_{n+1}$ and set $A=[t=n]$, and $I_{A}=$ indicator function of $A$. Then

$$
\begin{align*}
E\left(x_{t} \mid \mathfrak{F}_{n}\right) & =I_{A} \cdot x_{n}+I_{\Omega-A} \cdot E\left(x_{t^{\prime}} \mid \mathfrak{F}_{n}\right)  \tag{18}\\
& =I_{A} \cdot x_{n}+I_{\Omega-A} \cdot E\left(E\left(x_{t^{\prime}} \mid \mathfrak{F}_{n+1}\right) \mid \mathfrak{F}_{n}\right) \\
& \leq I_{A} \cdot x_{n}+I_{\Omega-A} \cdot E\left(\gamma_{n+1} \mid \mathfrak{F}_{n}\right) \leq \max \left(x_{n}, E\left(\gamma_{n+1} \mid F_{n}\right)\right)
\end{align*}
$$

To prove the reverse inequality, choose, by lemma $1,\left\{t_{k}\right\}_{1}^{\infty} \in C_{n+1}$ such that

$$
\begin{equation*}
x_{n+1} \leq E\left(x_{t_{k}} \mid \mathfrak{F}_{n+1}\right) \uparrow \gamma_{n+1} \quad \text { as } \quad k \rightarrow \infty ; \tag{19}
\end{equation*}
$$

then by the monotone convergence theorem for conditional expectations,

$$
\begin{equation*}
E\left(\gamma_{n+1} \mid \mathfrak{F}_{n}\right)=E\left(\lim _{k \rightarrow \infty} E\left(x_{t k} \mid \mathfrak{F}_{n+1}\right) \mid \mathfrak{F}_{n}\right)=\lim _{k \rightarrow \infty} E\left(x_{t k} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n} . \tag{20}
\end{equation*}
$$

And since $t=n$ is in $C_{n}, x_{n}=E\left(x_{n} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n}$. This completes the proof of (a).
(b). Since for each $t$ in $C_{n}, E\left(x_{t} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n}, E\left(x_{t}\right) \leq E\left(\gamma_{n}\right)$, so $v_{n} \leq E\left(\gamma_{n}\right)$. Now choose $\left\{t_{k}\right\}_{1}^{\infty}$ in $C_{n}$, according to lemma 1 ; then

$$
\begin{equation*}
E\left(\gamma_{n}\right)=\lim _{k \rightarrow \infty} E\left(x_{t_{k}}\right) \leq v_{n} \tag{21}
\end{equation*}
$$

Lemma 4. If $t \in C$, then

$$
\begin{equation*}
t \geq n \Rightarrow E\left(x_{t} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n} \quad \text { and } \quad E\left(x_{t}^{-} \mid \mathfrak{F}_{n}\right) \geq \gamma_{n}^{-} \tag{22}
\end{equation*}
$$

Proof. Set $t^{\prime}=\max (t, n) \in C_{n}$. By definition of $\gamma_{n}$,

$$
\begin{equation*}
t \geq n \Rightarrow E\left(x_{t} \mid \mathfrak{F}_{n}\right)=E\left(x_{t^{\prime}} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n} \tag{23}
\end{equation*}
$$

and hence

$$
\begin{equation*}
t \geq n \Rightarrow E\left(x_{t}^{-} \mid \mathfrak{F}_{n}\right) \geq E^{-}\left(x_{t} \mid \mathfrak{F}_{n}\right) \geq \gamma_{n}^{-} \tag{24}
\end{equation*}
$$

## 5. The r.v. $\sigma$

We define the r.v.

$$
\begin{equation*}
\sigma=\text { first } n \geq 1 \text { such that } x_{n}=\gamma_{n} \quad(=\infty \text { if no such } n \text { exists }) . \tag{25}
\end{equation*}
$$

In general, $P[\sigma<\infty]<1$, so that $\sigma$ is not always a s.v.
Lemma 5. If $t \in C$, then $t^{\prime}=\min (t, \sigma) \in C$ and $E\left(x_{t^{\prime}}\right) \geq E\left(x_{t}\right)$.
Proof. From lemma 4 we have

$$
\begin{align*}
E\left(x_{l^{-}}^{-}\right) & =\int_{\left[t^{\prime}=t\right]} x_{t^{\prime}}^{-}+\sum_{n=1}^{\infty} \int_{[t>n=\sigma]} x_{t}^{-} \geq \int_{\left[t^{\prime}=t\right]} x_{t^{\prime}}^{-}+\sum_{n=1}^{\infty} \int_{[t>n=\sigma]} \gamma_{n}^{-}  \tag{26}\\
& =\int_{\left[t^{\prime}=t\right]} x_{t^{\prime}}^{-}+\sum_{n=1}^{\infty} \int_{[t>n=\sigma]} x_{n}^{-}=E\left(x_{t^{\prime}}^{-\bar{\prime}}\right)
\end{align*}
$$

so that $t^{\prime} \in C$. The same argument without the - and with reversed inequality proves the inequality $E\left(x_{t}\right) \leq E\left(x_{t^{\prime}}\right)$.

A s.v. $t \in C$ is optimal if $v=E\left(x_{t}\right)$. A s.v. $t$ in $C$ is regular if it is 1-regular; that is, if for each $n \geq 1, t>n \Rightarrow E\left(x_{t} \mid \mathfrak{F}_{n}\right)>x_{n}$.

Theorem 2. (a) If $\sigma \in C$ and is regular, then it is optimal. (b) If $v<\infty$ and an optimal s.v. exists, then $\sigma \in C$ and is optimal and regular; moreover, $\sigma$ is the minimal optimal s.v. and

$$
\begin{equation*}
\sigma \geq n \Rightarrow E\left(x_{\sigma} \mid \mathfrak{F}_{n}\right)=E\left(\gamma_{\sigma} \mid \mathfrak{F}_{n}\right)=\gamma_{n} \quad(n \geq 1) \tag{27}
\end{equation*}
$$

Proof. (a) If $\sigma \in C$ and is regular, then $\sigma>n \Rightarrow E\left(x_{\sigma} \mid \mathfrak{F}_{n}\right)>x_{n}$ for each $n \geq 1$. And for any $t \in C, \sigma=n, t \geq n \Rightarrow E\left(x_{t} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n}=x_{n}$ by lemma 4 . Hence by lemma 1 of [1], $\sigma$ is optimal.
(b) Since $v<\infty, v_{n}=E\left(\gamma_{n}\right)<\infty$ for each $n \geq 1$. Let $s$ in $C$ be any optimal s.v., set $A=[s=n<\sigma]$, and suppose $P(A)>0$. Then

$$
\begin{equation*}
\int_{A} \gamma_{n}>\int_{A} x_{n}+\epsilon \quad \text { for some } \epsilon>0 \tag{28}
\end{equation*}
$$

Choose $\left\{t_{k}\right\}_{1}^{\infty}$ in $C_{n}$ by lemma 1 ; then $\int_{A} x_{t_{k}} \uparrow \int_{A} \gamma_{n}$, so that we can find $k$ so large that $\int_{A} x_{t_{k}}>\int_{A} \gamma_{n}-\epsilon$. Set

$$
s^{\prime}= \begin{cases}s & \text { off } A  \tag{29}\\ t_{k} & \text { on } A\end{cases}
$$

then it is easy to see that $s^{\prime}$ is a s.v. in $C$. But

$$
\begin{equation*}
E\left(x_{s^{\prime}}\right)=\int_{\Omega-A} x_{s}+\int_{A} x_{t_{k}}>\int_{\Omega-A} x_{s}+\int_{A} x_{n}=E\left(x_{s}\right), \tag{30}
\end{equation*}
$$

a contradiction. Hence $P(A)=0$, and thus $P[\sigma \leq s]=1$, so $\sigma$ is a s.v. By lemma $5, \sigma=\min (s, \sigma)$ is in $C$ and $\sigma$ is optimal and minimal.

For any $n \geq 1$, let $A=\left[E\left(x_{\sigma} \mid \mathfrak{F}_{n}\right)<\gamma_{n}, \sigma>n\right] \in \mathfrak{F}_{n}$. If $P(A)>0$, then $\int_{A} \gamma_{n}>\int_{A} x_{\sigma}$, since $E\left(\gamma_{n}\right) \leq E\left(\gamma_{1}\right)=v<\infty$. By lemma 1, there exists $t$ in $C_{n}$ such that $\int_{A} x_{t}>\int_{A} x_{\sigma}$. Define

$$
\tau= \begin{cases}t & \text { on } A  \tag{31}\\ \sigma & \text { off } A\end{cases}
$$

then it is easy to see that $\tau$ is a s.v. in $C$ and $E\left(x_{\tau}\right)>E\left(x_{\sigma}\right)=v$, a contradiction. Hence $P(A)=0$, and by lemma 4,

$$
\begin{equation*}
\sigma>n \Rightarrow E\left(\gamma_{\sigma} \mid \mathfrak{F}_{n}\right)=E\left(x_{\sigma} \mid \mathfrak{F}_{n}\right)=\gamma_{n}>x_{n} \tag{32}
\end{equation*}
$$

so $\sigma$ is regular and the last part of (b) holds.

## 6. Bounded stopping variables

The r.v.'s $\gamma_{n}$ and the constants $v_{n}$ are in general impossible to compute directly.
To this end we define for any $N \geq 1$ and $1 \leq n \leq N$ the expressions

$$
\begin{align*}
& C_{n}^{N}=\text { all } t \in C_{n} \text { such that } P[t \leq N]=1 ; v_{n}^{N}=\sup _{t \in C_{n}^{N}} E\left(x_{t}\right) ;  \tag{33}\\
& \gamma_{n}^{N}=\underset{t \in C_{n}^{N}}{\operatorname{ess} \sup } E\left(x_{t} \mid \mathfrak{F}_{n}\right) \tag{34}
\end{align*}
$$

Then

$$
\begin{equation*}
-\infty<E\left(x_{n}\right)=v_{n}^{n} \leq v_{n}^{n+1} \leq \cdots \leq v_{n} \text { and } x_{n}=\gamma_{n}^{n} \leq \gamma_{n}^{n+1} \leq \cdots \leq \gamma_{n} \tag{35}
\end{equation*}
$$

so that we can define

$$
\begin{equation*}
v_{n}^{\prime}=\lim _{N \rightarrow \infty} v_{n}^{N}, \quad \gamma_{n}^{\prime}=\lim _{N \rightarrow \infty} \gamma_{n}^{N}, \tag{36}
\end{equation*}
$$

and we have

$$
\begin{equation*}
-\infty<E\left(x_{n}\right) \leq v_{n}^{\prime} \leq v_{n}, \quad x_{n} \leq \gamma_{n}^{\prime} \leq \gamma_{n} \tag{37}
\end{equation*}
$$

By the argument of theorem 1 applied to the finite sequence $\left\{x_{n}\right\}_{1}^{N}$, we have

$$
\begin{align*}
& \gamma_{N}^{N}=x_{N} \\
& \gamma_{n}^{N}=\max \left(x_{n}, E\left(\gamma_{n+1}^{N} \mid \mathfrak{F}_{n}\right)\right), \quad(n=1, \cdots, N-1), \tag{38}
\end{align*}
$$

and $E\left(\gamma_{n}^{N}\right)=v_{n}^{N}$, so that $\gamma_{n}^{N}$ and $v_{n}^{N}$ are computable by recursion. By the monotone convergence theorem for expectations and conditional expectations, $E\left(\gamma_{n}^{\prime}\right)=v_{n}^{\prime}$, and

$$
\begin{equation*}
\gamma_{n}^{\prime}=\max \left(x_{n}, E\left(\gamma_{n+1}^{\prime} \mid \mathfrak{F}_{n}\right)\right), \quad(n \geq 1) \tag{39}
\end{equation*}
$$

Hence $\left\{\gamma_{n}^{\prime}\right\}_{1}^{\infty}$ satisfies the same recursion relation as does $\left\{\gamma_{n}\right\}_{1}^{\infty}$. (In [2], $\gamma_{n}^{N}=\beta_{n}^{N}$, $\gamma_{n}^{\prime}=\beta_{n}$.)

Theorem 3. If the condition $A^{-}: E\left(\sup _{n} x_{n}^{-}\right)<\infty$ holds, then

$$
\begin{equation*}
\gamma_{n}^{\prime}=\gamma_{n} \quad \text { and } \quad v_{n}^{\prime}=v_{n} \tag{40}
\end{equation*}
$$

$$
(n \geq 1)
$$

Proof. For any $t \in C_{n}$ and $A \in \mathcal{F}_{n}$,

$$
\begin{equation*}
\int_{A[t \leq N]} x_{t} \leq \int_{A} x_{\min (t, N)}+\int_{A[t>N]} x_{\bar{N}} \tag{41}
\end{equation*}
$$

Since $E\left(x_{\min (t, N)} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n}^{N} \leq \gamma_{n}^{\prime}$,

$$
\begin{equation*}
\int_{A[t \leq N]} x_{t} \leq \int_{A} \gamma_{n}^{\prime}+\int_{A[t>N]}\left(\sup _{m} x_{m}^{-}\right) \tag{42}
\end{equation*}
$$

Letting $N \rightarrow \infty$,

$$
\begin{equation*}
\int_{A} x_{t} \leq \int_{A} \gamma_{n}^{\prime}, \quad E\left(x_{t} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n}^{\prime}, \quad \gamma_{n} \leq \gamma_{n}^{\prime} \tag{43}
\end{equation*}
$$

so $\gamma_{n}=\gamma_{n}^{\prime}$ and $v_{n}=v_{n}^{\prime}$.
Corollary. If $A^{-}$holds and $\left\{x_{n}\right\}_{1}^{\infty}$ is Markovian, and $\mathfrak{F}_{n}=\circledast\left(x_{1}, \cdots, x_{n}\right)$, then $\gamma_{n}=E\left(\gamma_{n} \mid x_{n}\right)$.

Proof. The Markovian property of $\left\{x_{n}\right\}_{1}^{\infty}$ implies (by downward induction on $n$ ) $\gamma_{n}^{N}=E\left(\gamma_{n}^{N} \mid x_{n}\right)$ which entails $\gamma_{n}^{\prime}=E\left(\gamma_{n}^{\prime} \mid x_{n}\right)$, and then $\gamma_{n}=E\left(\gamma_{n} \mid x_{n}\right)$. (The assumption $A^{-}$will be dropped in the corollary to theorem 9. )

## 7. Supermartingales

A sequence $\left\{y_{n}\right\}_{1}^{\infty}$ of r.v.'s is a supermartingale (or lower semimartingale) if for each $n \geq 1, y_{n}$ is measurable ( $\mathcal{F}_{n}$ ), $E\left(y_{n}\right)$ exists, $-\infty \leq E\left(y_{n}\right) \leq \infty$, and $E\left(y_{n+1} \mid \mathfrak{F}_{n}\right) \leq y_{n}$. We shall denote by $D$ the class of all supermartingales $\left\{y_{n}\right\}_{1}^{\infty}$ such that $y_{n} \geq x_{n}$ for each $n \geq 1$. The sequences $\left\{\gamma_{n}\right\}_{1}^{\infty}$ and $\left\{\gamma_{n}^{\prime}\right\}_{1}^{\infty}$ are in $D$.

Theorem 4. The sequence $\left\{\gamma_{n}^{\prime}\right\}$ is the minimal element of $D$.
Proof. For any $\left\{y_{n}\right\}_{1}^{\infty}$ in $D$,

$$
\begin{align*}
y_{n} & \geq x_{n}=\gamma_{n}^{n}, \\
y_{n-1} & \geq E\left(y_{n} \mid \mathfrak{F}_{n-1}\right) \geq E\left(\gamma_{n}^{n} \mid \mathfrak{F}_{n-1}\right),  \tag{44}\\
y_{n-1} & \geq \max \left(x_{n-1}, E\left(\gamma_{n}^{n} \mid \mathfrak{F}_{n-1}\right)\right)=\gamma_{n-1}^{n}, \cdots, y_{i} \geq \gamma_{i}^{n}, \cdots
\end{align*}
$$

so that

$$
\begin{equation*}
y_{i} \geq \lim _{n \rightarrow \infty} \gamma_{i}^{n}=\gamma_{i}^{\prime} \tag{45}
\end{equation*}
$$

We shall define various types of "regularity" for elements of $D$, according to the class of s.v.'s $t$ for which $E\left(y_{t}\right)$ is assumed to exist and the relation

$$
\begin{equation*}
t \geq n \Rightarrow E\left(y_{t} \mid \mathfrak{F}_{n}\right) \leq y_{n} \tag{46}
\end{equation*}
$$

to hold. An element $\left\{y_{n}\right\}_{1}^{\infty}$ of $D$ is said to be
(a) regular if for every s.v. $t, E\left(y_{t}\right)$ exists and (46) holds;
(b) semiregular if for every s.v. $t$ such that $E\left(y_{t}\right)$ exists, (46) holds;
(c) C-regular if for every s.v. $t \in C$ (for which $E\left(y_{t}\right)$ necessarily exists), (46) holds.

Clearly, for elements of $D$, regular $\Rightarrow$ semiregular $\Rightarrow C$-regular.
We shall use the notation $A^{+}: E\left(\sup _{n} x_{n}^{+}\right)<\infty, A^{*}: E\left(x_{t}\right)$ exists for every s.v. $t$. Clearly, $A^{+} \Rightarrow A^{*} \Leftarrow A^{-}$.

Lemma 6. If $A^{*}$ holds, then for any $\epsilon>0$ and $n \geq 1$, there exists $s \in C_{n}$ such that

$$
\begin{equation*}
E\left(x_{s} \mid \mathfrak{F}_{n}\right)>\gamma_{n}-\epsilon \quad \text { on }\left[\gamma_{n}<\infty\right] . \tag{47}
\end{equation*}
$$

Proof. Choose $\left\{t_{k}\right\}_{1}^{\infty}$ in $C_{n}$ by lemma 1. On $\left[\gamma_{n}<\infty\right]$ define $\alpha=$ first $k \geq 1$ such that $E\left(x_{t_{k}} \mid F_{n}\right)>\gamma_{n}-\epsilon$, and set

$$
s=\left\{\begin{array}{l}
t_{\alpha} \text { on }\left[\gamma_{n}<\infty\right]  \tag{48}\\
n \text { elsewhere } .
\end{array}\right.
$$

Then $E\left(x_{s}\right)$ exists, and on $\left[\gamma_{n}<\infty\right], E\left(x_{s} \mid \mathfrak{F}_{n}\right)>\gamma_{n}-\epsilon$. Hence,

$$
\begin{equation*}
E\left(x_{s}\right) \geq \int_{\left[\gamma_{n}<\infty\right]}\left(\gamma_{n}-\epsilon\right)+\int_{\left[\gamma_{n}=\infty\right]} x_{n}>-\infty \tag{49}
\end{equation*}
$$

so that $s \in C_{n}$.
Lemma 7. (a) Condition $A^{-}$implies $E\left(\gamma_{t}^{-}\right)=E\left(\left(\gamma_{t}^{\prime}\right)^{-}\right)<\infty$ for every s.v. $t$, and (b) condition $A^{+}$implies $E\left(\left(\gamma_{t}^{\prime}\right)^{+}\right) \leq E\left(\gamma_{t}^{+}\right)<\infty$ for every s.v. $t$.

Proof. (a) Since by theorem $3 x_{n} \leq \gamma_{n}^{\prime}=\gamma_{n}, \gamma_{t}^{-}=\left(\gamma_{t}^{\prime}\right)^{-} \leq \sup x_{n}^{-}$.
(b) Since

$$
\begin{equation*}
\gamma_{n}^{+}=\underset{t \in C_{n}}{\operatorname{ess} \sup ^{2}} E^{+}\left(x_{t} \mid \mathfrak{F}_{n}\right) \leq E\left(\sup _{j} x_{j}^{+} \mid \mathfrak{F}_{n}\right), \tag{50}
\end{equation*}
$$

then

$$
\begin{align*}
E\left(\left(\gamma_{t}^{\prime}\right)^{+}\right) \leq E\left(\gamma_{t}^{+}\right) & =\sum_{n=1}^{\infty} \int_{[t=n]} \gamma_{n}^{+} \leq \sum_{n=1}^{\infty} \int_{[t=n]} E\left(\sup _{j} x_{j}^{+} \mid \mathfrak{F}_{n}\right)  \tag{51}\\
& =E\left(\sup _{j} x_{j}^{+}\right)
\end{align*}
$$

Theorem 5. (a) If $\left\{y_{n}\right\}_{1}^{\infty} \in D$ and is $C$-regular, then $y_{n} \geq \gamma_{n}$ for each $n \geq 1$;
(b) $A^{*} \Rightarrow\left\{\gamma_{n}\right\}_{1}^{\infty}$ is semiregular;
(c) $A^{-}$or $A^{+} \Rightarrow\left\{\gamma_{n}\right\}_{1}^{\infty}$ is regular;
(d) $\left\{\gamma_{n}\right\}_{1}^{\infty}$ is $C$-regular.

Proof. (a) If $\left\{y_{n}\right\}_{1}^{\infty} \in D$ and is $C$-regular, then

$$
\begin{equation*}
\gamma_{n}=\underset{t \in C_{n}}{\operatorname{ess} \sup _{n}} E\left(x_{t} \mid \mathfrak{F}_{n}\right) \leq \underset{t \in C_{n}}{\operatorname{ess} \sup _{n}} E\left(y_{t} \mid \mathfrak{F}_{n}\right) \leq y_{n} \tag{52}
\end{equation*}
$$

(b) Let $\tau$ be any s.v. such that $P[\tau \geq n]=1$ and $E\left(\gamma_{\tau}\right)$ exists. For arbitrary $\epsilon>0, k \geq n$, and $m \geq 1$, setting $A_{m}=\left[\gamma_{n}<m\right]$, we have

$$
\begin{equation*}
m \geq \int_{A_{m}} \gamma_{n} \geq \int_{A_{m}} \gamma_{n+1} \geq \cdots \geq \int_{A_{m}} \gamma_{k} \geq \cdots \tag{53}
\end{equation*}
$$

so that $\gamma_{k}<\infty$ on $A_{m}$. Hence, $\gamma_{k}<\infty$ on $A=\left[\gamma_{n}<\infty\right]$. By lemma 6, we can choose $t_{k} \in C_{k}$ such that

$$
\begin{equation*}
E\left(x_{t_{k}} \mid F_{k}\right)>\gamma_{k}-\epsilon \quad \text { on } \quad A \tag{54}
\end{equation*}
$$

Define

$$
t= \begin{cases}t_{k} & \text { on } A[\tau=k],  \tag{55}\\ \tau & \text { off } A\end{cases}
$$

Then $E\left(x_{t}\right)$ exists, and on $A$,

$$
\begin{align*}
E\left(x_{t} \mid \mathfrak{F}_{n}\right) & =E\left(\sum_{k=n}^{\infty} I_{[\tau=k]} \cdot E\left(x_{t_{k}} \mid F_{k}\right) \mid \mathfrak{F}_{n}\right) \geq E\left(\sum_{k=n}^{\infty} I_{[\tau=k]}\left(\gamma_{k}-\epsilon\right) \mid F_{n}\right)  \tag{56}\\
& =E\left(\gamma_{\gamma} \mid \mathfrak{F}_{n}\right)-\epsilon
\end{align*}
$$

and therefore on $A$, by the remark preceding lemma 1 ,

$$
\begin{equation*}
\gamma_{n}=\underset{t \in \widetilde{C}_{n}}{\operatorname{ess} \sup } E\left(x_{t} \mid \mathfrak{F}_{n}\right) \geq E\left(\gamma_{\tau} \mid \mathfrak{F}_{n}\right)-\epsilon \tag{57}
\end{equation*}
$$

(recall that $\widetilde{C}_{n}=$ all s.v.'s $t \geq n$ such that $E\left(x_{t}\right)$ exists). Hence,

$$
\begin{equation*}
\gamma_{n} \geq E\left(\gamma_{\tau} \mid F_{n}\right) \tag{58}
\end{equation*}
$$

on $\Omega$.
Now let $t$ be any s.v. such that $E\left(\gamma_{t}\right)$ exists. Set $\tau=\max (t, n)$. Then if $E\left(\gamma_{t}^{+}\right)=\infty, E\left(\gamma_{t}^{-}\right)<\infty$, and hence

$$
\begin{equation*}
E\left(\gamma_{\tau}^{-}\right)=\int_{[t>n]} \gamma_{\imath}^{-}+\int_{[t \leq n]} \gamma_{n}^{-}<\infty, \tag{59}
\end{equation*}
$$

while if $E\left(\gamma_{t}^{+}\right)<\infty$, then

$$
\begin{equation*}
E\left(\gamma_{\tau}^{+}\right)=\int_{[t>n]} \gamma_{t}^{+}+\int_{[t \leq n]} \gamma_{n}^{+}<\infty \tag{60}
\end{equation*}
$$

since

$$
\begin{equation*}
\infty>\int_{[t \leq n]} \boldsymbol{\gamma}_{t}=\sum_{k=1}^{n} \int_{[t=k]} \boldsymbol{\gamma}_{k} \geq \sum_{k=1}^{n} \int_{[t=k]} \gamma_{n}=\int_{[t \leq n]} \boldsymbol{\gamma}_{n} . \tag{61}
\end{equation*}
$$

Hence $E\left(\gamma_{\tau}\right)$ exists. By the previous result, $\gamma_{n} \geq E\left(\gamma_{\tau} \mid F_{n}\right)$, and hence,

$$
\begin{equation*}
t \geq n \Rightarrow \gamma_{n} \geq E\left(\gamma_{\tau} \mid \mathfrak{F}_{n}\right)=E\left(\gamma_{t} \mid \mathfrak{F}_{n}\right) \tag{62}
\end{equation*}
$$

(c) This statement follows from (b) and lemma 7.
(d) For $0 \leq b<\infty$, let $x_{n}(b)=\min \left(x_{n}, b\right)$, and let $\gamma_{n}^{b}\left(\leq \gamma_{n}\right)$ denote $\gamma_{n}$ for the sequence $\left\{x_{n}(b)\right\}_{1}^{\infty}$. As $b \rightarrow \infty,-x_{n}^{-} \leq \gamma_{n}^{b} \uparrow \tilde{\gamma}_{n}$, say, where $\tilde{\gamma}_{n} \leq \gamma_{n}$, and for any $t$ in $C_{n}, x_{t}(b) \geq-x_{t}^{-}$, so that $E\left(x_{t}(b) \mid F_{n}\right) \uparrow E\left(x_{t} \mid F_{n}\right)$. Since $\tilde{\gamma}_{n} \geq \gamma_{n}^{b} \geq$ $E\left(x_{t}(b) \mid \mathfrak{F}_{n}\right), \tilde{\gamma}_{n} \geq E\left(x_{t} \mid \mathfrak{F}_{n}\right)$, and hence $\tilde{\gamma}_{n} \geq \gamma_{n}, \tilde{\gamma}_{n}=\gamma_{n}$. Now if $t \in C$, then by (c), $t \geq n \Rightarrow E\left(\gamma_{i}^{b} \mid F_{n}\right) \leq \gamma_{n}^{b} \leq \gamma_{n}$. As $b \rightarrow \infty$, since $\gamma_{t}^{b} \geq-x_{t}^{-}$and $E\left(x_{t}^{-}\right)<\infty$, $t \geq n \Rightarrow E\left(\gamma_{t} \mid \mathfrak{F}_{n}\right) \leq \gamma_{n}$, so $\left\{\gamma_{n}\right\}_{1}^{\infty}$ is $C$-regular.

Corollary 1. (a) The sequence $\left\{\gamma_{n}\right\}_{1}^{\infty}$ is the minimal $C$-regular element of $D$.
(b) Condition $A^{*}$ implies that $\left\{\gamma_{n}\right\}_{1}^{\infty}$ is the minimal semiregular element of $D$.
(c) Either $A^{-}$or $A^{+}$implies that $\left\{\gamma_{n}\right\}_{1}^{\infty}$ is the minimal regular element of $D$.

We remark that under $A^{-}, E\left(\sup _{n} \gamma_{n}^{-}\right) \leq E\left(\sup _{n} x_{n}^{-}\right)<\infty$. Hence, by a wellknown theorem, $\left\{\gamma_{n}\right\}_{1}^{\infty}$ is regular, and similarly for $\left\{\gamma_{n}^{\prime}\right\}_{1}^{\infty}$. By theorems 4 and $5(\mathrm{a}),\left\{\gamma_{n}^{\prime}\right\}_{1}^{\infty}=\left\{\gamma_{n}\right\}_{1}^{\infty}$, which gives an alternative proof of theorem 3.

Corollary 2. If $\gamma_{n}^{b}=\operatorname{ess} \sup _{t \in C_{n}} E\left(\min \left(x_{t}, b\right) \mid \mathfrak{F}_{n}\right)$, then

$$
\begin{equation*}
\gamma_{n}=\lim _{b \rightarrow \infty} \gamma_{n}^{b} \quad(n \geq 1) \tag{63}
\end{equation*}
$$

## 8. Almost optimal stopping variables

Lemma 8. If $v<\infty$, then for any $\epsilon>0, P\left[x_{n} \geq \gamma_{n}-\epsilon\right.$, i.o. $]=1$.
Proof. Since $\infty>v=E\left(\gamma_{1}\right) \geq E\left(\gamma_{2}\right) \geq \cdots$, we have $P\left[\gamma_{n}<\infty\right]=1$ for each $n \geq 1$. Choose any $\epsilon>0$ and $r>0$, and define for $n \geq 1$,

$$
\begin{equation*}
B_{n}=\left[E\left(x_{t_{n}} \mid F_{n}\right)>\gamma_{n}-\frac{\epsilon}{r}\right] \tag{64}
\end{equation*}
$$

where $\left\{t_{n}\right\}_{1}^{\infty}$ is chosen by lemma 1 for each $n \geq 1$ so that $t_{n} \in C_{n}$ and $P\left(B_{n}\right)>$ $1-1 / r$ (convergence a.e. $\Rightarrow$ convergence in probability). Define

$$
\begin{equation*}
B=\left[x_{n}<\gamma_{n}-\epsilon \text { for all } n \geq m\right] \tag{65}
\end{equation*}
$$

where $m$ is any fixed positive integer. Then

$$
\begin{equation*}
x_{n} \leq \gamma_{n}-\epsilon I_{B} \quad \text { for } n \geq m \tag{66}
\end{equation*}
$$

so on $B_{n}$ for any $n \geq m$,

$$
\begin{array}{rlr}
\gamma_{n}-\frac{\epsilon}{r}<E\left(x_{t_{n}} \mid \mathfrak{F}_{n}\right) & \leq E\left(\gamma_{t_{n}} \mid \mathfrak{F}_{n}\right)-\epsilon P\left(B \mid \mathfrak{F}_{n}\right)  \tag{67}\\
& \leq \gamma_{n}-\epsilon P\left(B \mid \mathfrak{F}_{n}\right) \quad \text { by theorem } 5(\mathrm{~d}) .
\end{array}
$$

Hence on $B_{n}, P\left(B \mid \mathfrak{F}_{n}\right) \leq 1 / r$, and therefore $P\left(B B_{n}\right) \leq 1 / r$. It follows that $P(B) \leq P\left(B B_{n}\right)+P\left(\Omega-B_{n}\right) \leq(1 / r)+(1 / r)=(2 / r)$. Since $r$ can be arbitrarily large, $P(B)=0$, and therefore,

$$
\begin{equation*}
P\left[x_{n} \geq \gamma_{n}-\epsilon \text { for some } n \geq m\right]=1 \tag{68}
\end{equation*}
$$

and

$$
\begin{equation*}
P\left[x_{n} \geq \gamma_{n}-\epsilon, \text { i.o. }\right]=\lim _{m \rightarrow \infty} 1=1 \tag{69}
\end{equation*}
$$

Theorem 6. For any $\epsilon \geq 0$, define

$$
\begin{equation*}
s=\text { first } n \geq 1 \text { such that } x_{n} \geq \gamma_{n}-\epsilon(s=\infty \text { if no such } n \text { exists }) \tag{70}
\end{equation*}
$$

Assume the following: (a) $P[s<\infty]=1$,
(b) $E\left(x_{\mathrm{s}}\right)$ exists,
(c) $\liminf _{n \rightarrow \infty} \int_{[s>n]} E^{+}\left(\gamma_{n+1} \mid \mathfrak{F}_{n}\right)=0$.

Then $E\left(x_{s}\right) \geq v-\epsilon$.
Proof. We can assume $E\left(x_{s}\right)<\infty$. Since $\gamma_{s} \leq x_{s}+\epsilon, E\left(\gamma_{s}\right)<\infty$. Now

$$
\begin{align*}
v & =E\left(\gamma_{1}\right)=\int_{[s=1]} \gamma_{s}+\int_{[s>1]} E\left(\gamma_{2} \mid \mathfrak{F}_{1}\right)  \tag{7.1}\\
& =\int_{[s=1]} \gamma_{s}+\int_{[s=2]} \gamma_{s}+\int_{[s>2]} E\left(\gamma_{3} \mid \mathfrak{F}_{2}\right)=\cdots \\
& =\int_{[1 \leq s \leq n]} \gamma_{s}+\int_{[s>n]} E\left(\gamma_{n+1} \mid F_{n}\right) \leq \int_{[1 \leq s \leq n]} \gamma_{s}+\int_{[s>n]} E^{+}\left(\gamma_{n+1} \mid F_{n}\right)
\end{align*}
$$

Letting $n \rightarrow \infty, v \leq E\left(\gamma_{s}\right) \leq E\left(x_{s}\right)+\epsilon$.
Corollary. For any $\epsilon \geq 0$, define s by (70). Then
(i) for $\epsilon>0, A^{+} \Rightarrow P[s<\infty]=1$ and $E\left(x_{s}\right) \geq v-\epsilon$;
(ii) for $\epsilon=0,\left\{A^{+}, P[s<\infty]=1\right\} \Rightarrow E\left(x_{s}\right)=v$.

Proof. Condition $A^{+}$implies $v<\infty$, and by lemma 8, this implies that $P[s<\infty]=1$. Condition $A^{+}$also implies (b) and (c).

Theorem 7. Let $\left\{\alpha_{n}\right\}_{1}^{\infty}$ be any sequence of r.v.'s such that $\alpha_{n}$ is $\left(\mathfrak{F}_{n}\right)$ measurable and $E\left(\alpha_{n}\right)$ exists for each $n \geq 1$, and such that
(a)

$$
\alpha_{n}=\max \left(x_{n}, E\left(\alpha_{n+1} \mid \mathfrak{F}_{n}\right)\right),
$$

(b) $P\left[x_{n} \geq \alpha_{n}-\epsilon\right.$ i.o. $]=1$ for every $\epsilon>0$,
(c) $\left\{E^{+}\left(\alpha_{n+1} \mid \mathfrak{F}_{n}\right)\right\}_{1}^{\infty}$ is uniformly integrable,
(d)

$$
\text { either } E\left(\sup _{n} \alpha_{n}^{-}\right)<\infty, \text { or } A^{+} \text {holds }
$$

Then for each $n \geq 1, \alpha_{n} \leq \gamma_{n}$.
Proof. For $m \geq 1, A \in \mathcal{F}_{m}$, and $\epsilon>0$, define $t=$ first $n \geq m$ such that $x_{n} \geq \alpha_{n}-\epsilon$. Then $P[m \leq t<\infty]=1$. If the first part of (d) holds, then $E\left(\alpha_{t}^{-}\right)<\infty$, and since $x_{t} \geq \alpha_{t}-\epsilon$, it follows that $E\left(x_{t}^{-}\right)<\infty$, and hence, by theorem 5(d),

$$
\begin{equation*}
\int_{A} \alpha_{t} \leq \int_{A} x_{t}+\epsilon \leq \int_{A} \gamma_{t}+\epsilon \leq \int_{A} \gamma_{m}+\epsilon \tag{72}
\end{equation*}
$$

If $A^{+}$holds, then $E\left(\alpha_{t}^{+}\right) \leq E\left(x_{t}^{+}\right)+\epsilon<\infty$, and the same result follows from theorem 5(c). Now

$$
\begin{align*}
& \int_{A} \alpha_{m}=\int_{A[t=m]} \alpha_{t}+\int_{A[t>m]} \alpha_{m+1}=\cdots=\int_{A[m \leq t \leq m+k]} \alpha_{t}  \tag{73}\\
& \quad+\int_{A[t>m+k]} \alpha_{m+k+1} \leq \int_{A[m \leq t \leq m+k]} \alpha_{t}+\int_{A[t>m+k]} E^{+}\left(\alpha_{m+k+1} \mid F_{m+k}\right)
\end{align*}
$$

Letting $k \rightarrow \infty$, it follows from (c) that

$$
\begin{equation*}
\int_{A} \alpha_{m} \leq \int_{A} \alpha_{t} \leq \int_{A} \gamma_{m}+\epsilon \tag{74}
\end{equation*}
$$

so since $\epsilon$ was arbitrarily small, $\int_{A} \alpha_{m} \leq \int_{A} \gamma_{m}$, and therefore, $\alpha_{m} \leq \gamma_{m}$.

Corollary. Assume that $A^{-}$holds. If $\left\{\alpha_{n}\right\}_{1}^{\infty}$ is any sequence such that $\alpha_{n}$ is measurable $\left(\mathfrak{F}_{n}\right), E\left(\alpha_{n}\right)$ exists for each $n \geq 1$, and (a), (b), and (c) hold, then

$$
\begin{equation*}
\alpha_{n}=\gamma_{n} . \tag{75}
\end{equation*}
$$

Proof. By theorems 7, 3, and 4, since $A^{-}$implies (d),

$$
\begin{equation*}
\gamma_{n}^{\prime} \leq \alpha_{n} \leq \gamma_{n}=\gamma_{n}^{\prime} \tag{76}
\end{equation*}
$$

## 9. A theorem of Dynkin

We next prove a slight generalization of a theorem of Dynkin [3]. Let $\left\{z_{n}\right\}_{1}^{\infty}$ be a homogeneous discrete time Markov process with arbitrary state space $Z$. For any nonnegative measurable function $g(\cdot)$ on $Z$, define the function $P g(\cdot)$ by

$$
\begin{equation*}
\operatorname{Pg}(z)=E\left(g\left(z_{n+1}\right) \mid z_{n}=z\right), \tag{77}
\end{equation*}
$$

and set

$$
\begin{equation*}
Q g=\max (g, P g), \quad Q_{\theta}^{k+1}=Q\left(Q^{k} g\right), \quad(k \geq 0), \quad Q_{\theta}^{\circ}=g \tag{78}
\end{equation*}
$$

Then $g \leq Q g \leq Q^{2} g \leq \cdots$, so

$$
\begin{equation*}
h=\lim _{N \rightarrow \infty} Q^{N} g \tag{79}
\end{equation*}
$$

exists. Let $\mathfrak{F}_{n}=\mathbb{B}\left(z_{1}, \cdots, z_{n}\right)$ and consider the sequence $\left\{x_{n}\right\}_{1}^{\infty}$ with $x_{n}=g\left(z_{n}\right)$.
Theorem 8. For the process defined above, $\sup _{t} E\left(g\left(z_{t}\right)\right)=E\left(h\left(z_{1}\right)\right)$.
Proof. By theorem 3,

$$
\begin{equation*}
\gamma_{1}=\gamma_{1}^{\prime}=\lim _{N \rightarrow \infty} \gamma_{1}^{N} \tag{80}
\end{equation*}
$$

where

$$
\begin{align*}
& \gamma_{N}^{N}=g\left(z_{N}\right) \\
& \gamma_{N-1}^{N}=\max \left(g\left(z_{N-1}\right), E\left(g\left(z_{N}\right) \mid z_{N-1}\right)\right)=Q g\left(z_{N-1}\right), \\
& \gamma_{N-2}^{N}=\max \left(g\left(z_{N-2}\right), E\left(Q g\left(z_{N-1}\right) \mid z_{N-2}\right)\right)=\max \left(g\left(z_{N-2}\right), P Q g\left(z_{N-2}\right)\right) \\
& \quad=\max \left(g\left(z_{N-2}\right), \operatorname{Pg}\left(z_{N-2}\right), P Q g\left(z_{N-2}\right)\right)=Q^{2} g\left(z_{N-2}\right),  \tag{81}\\
& \cdot \\
& \cdot \\
& \gamma_{1}^{N}=Q^{N-1} g\left(z_{1}\right) \rightarrow h\left(z_{1}\right) \quad \text { as } \quad N \rightarrow \infty .
\end{align*}
$$

Hence $\gamma_{1}=h\left(z_{1}\right)$ and $v=E\left(\gamma_{1}\right)=E\left(h\left(z_{1}\right)\right)$.

## 10. The triple limit theorem

Lemma 9. Assume $A^{+}$holds, and define

$$
\begin{array}{rlr}
x_{n}(a) & =\max \left(x_{n},-a\right), & (0 \leq a<\infty) \\
\gamma_{n}^{a} & =\underset{P[t \geq n]=1}{\operatorname{ess} \sup _{1} E\left(x_{t}(a) \mid \mathfrak{F}_{n}\right)} . \tag{82}
\end{array}
$$

Then

$$
\begin{equation*}
\gamma_{n}=\lim _{a \rightarrow \infty} \gamma_{n .}^{a} \tag{83}
\end{equation*}
$$

Proof. Since $\gamma_{n}^{a}=\max \left(x_{n}(a), E\left(\gamma_{n+1}^{a} \mid \mathfrak{F}_{n}\right)\right)$ and $\gamma_{n}(a) \downarrow \gamma_{n}^{*}$, say, as $a \rightarrow \infty$, where $\gamma_{n}^{*} \geq \gamma_{n}$, it follows from $A^{+}$that $\gamma_{n}^{*}=\max \left(x_{n}, E\left(\gamma_{n+1}^{*} \mid \mathfrak{F}_{n}\right)\right)$. For any $\epsilon>0$ and $m \geq 1$, define $s=$ first $n \geq m$ such that $x_{n} \geq \gamma_{n}^{*}-\epsilon(=\infty$ if no such $n$ exists). Then $\left\{\gamma_{\min (s, n)}^{*}\right\}_{n=m}^{\infty}$ is a martingale, since

$$
\begin{align*}
E\left(\gamma_{\min (s, n+1)}^{*}\right) & =I_{[s>n]} E\left(\gamma_{n+1}^{*} \mid \mathfrak{F}_{n}\right)+I_{[s \leq n]} E\left(\gamma_{s}^{*} \mid \mathfrak{F}_{n}\right)  \tag{84}\\
& =I_{[s>n]} \cdot \gamma_{n}^{*}+I_{[s=m]} \cdot \gamma_{m}^{*}+\cdots+I_{[s=n]} \cdot \gamma_{n}^{*}=\gamma_{\min (s, n)}^{*} .
\end{align*}
$$

Since $E\left(\left(\gamma_{\min (s, n)}^{*}\right)^{+}\right) \leq E\left(\sup _{n} x_{n}^{+}\right)<\infty$, and since $E\left(\left(\gamma_{m}^{*}\right)^{-}\right)<\infty$, we have by a martingale convergence theorem,

$$
\begin{equation*}
\gamma_{\min (s, n)}^{*} \rightarrow \text { a finite limit } \quad \text { as } n \rightarrow \infty \tag{85}
\end{equation*}
$$

and hence,

$$
\begin{equation*}
\gamma_{n}^{*} \rightarrow \text { a finite limit on }[s=\infty] \quad \text { as } n \rightarrow \infty \tag{86}
\end{equation*}
$$

But on [s $=\infty$ ], $\gamma_{n}^{*}>x_{n}+\epsilon$ for $n \geq m$, so

$$
\begin{equation*}
\lim _{n} \sup x_{n} \leq \lim _{n} \sup \gamma_{n}^{*}-\epsilon \quad \text { on } \quad[s=\infty] \tag{87}
\end{equation*}
$$

Since $\gamma_{n}^{a} \leq E\left(\sup _{j \geq m} x_{j}(a) \mid \mathfrak{F}_{n}\right)$ for $n \geq m$,

$$
\begin{equation*}
\lim _{n} \sup \gamma_{n}^{*} \leq \lim _{n} \sup \gamma_{n}^{a} \leq \sup _{j \geq m} x_{j}(a) \tag{88}
\end{equation*}
$$

and hence,

$$
\begin{equation*}
\lim _{n} \sup \gamma_{n}^{*} \leq \lim _{n} \sup x_{n}(a)=\max \left(\lim _{n} \sup x_{n},-a\right) \tag{89}
\end{equation*}
$$

and
(90) $\quad \lim _{n} \sup \gamma_{n}^{*} \leq \lim _{n} \sup x_{n}$,
but $\gamma_{n}^{*} \geq x_{n}$. Hence,

$$
\begin{equation*}
\limsup _{n} \gamma_{n}^{*}=\lim _{n} \sup x_{n} \tag{91}
\end{equation*}
$$

contradicting (87) unless $P[s=\infty]=0$. Hence,

$$
\begin{equation*}
P\left[x_{n} \geq \gamma_{n}^{*}-\epsilon, \text { i.o. }\right]=1 \tag{92}
\end{equation*}
$$

and by theorem 7, $\gamma_{n}^{*} \leq \gamma_{n}$. Therefore, $\gamma_{n}^{*}=\gamma_{n}$.
Theorem 9. The random variables $\gamma_{n}$ are equal to

$$
\begin{equation*}
\gamma_{n}=\lim _{b \rightarrow \infty} \lim _{a \rightarrow-\infty} \lim _{N \rightarrow \infty} \gamma_{n}^{N}(a, b) \tag{93}
\end{equation*}
$$

where

$$
\begin{equation*}
\gamma_{n}^{N}(a, b)=\underset{P[n \leq t \leq N]=1}{\operatorname{ess} \sup _{n}} E\left(x_{t}(a, b) \mid \mathfrak{F}_{n}\right) \tag{94}
\end{equation*}
$$

and

$$
x(a, b)=\left\{\begin{array}{lll}
a & \text { if } & x<a  \tag{95}\\
x & \text { if } & a \leq x \leq b \\
b & \text { if } & x>b
\end{array}\right.
$$

Proof. This follows from lemma 9, theorem 3, and corollary 2 of theorem 5.
Corollary 1. The values $v_{n}$ are equal to

$$
\begin{equation*}
\lim _{b \rightarrow \infty} \lim _{a \rightarrow-\infty} \lim _{N \rightarrow \infty} v_{n}^{N}(a, b) \tag{96}
\end{equation*}
$$

Corollary 2. If $\left\{x_{n}\right\}_{1}^{\infty}$ is Markovian and $\mathfrak{F}_{n}=\mathbb{}\left(x_{1}, \cdots, x_{n}\right)$, then

$$
\begin{equation*}
\gamma_{n}=E\left(\gamma_{n} \mid x_{n}\right) \tag{97}
\end{equation*}
$$

If the $x_{n}$ are independent, then

$$
\begin{equation*}
E\left(\gamma_{n+1} \mid \mathfrak{F}_{n}\right)=E\left(\gamma_{n+1}\right)=v_{n+1}, \tag{98}
\end{equation*}
$$

and the $v_{n}$ satisfy the recursion relation

$$
\begin{equation*}
v_{n}=E\left\{\max \left(x_{n}, v_{n+1}\right)\right\} \tag{99}
\end{equation*}
$$

Proof. By induction $\gamma_{n}^{N}(a, b)=E\left(\gamma_{n}^{N}(a, b) \mid x_{n}\right)$ from $n=N$ down, as in the proof of the corollary of theorem 3. Letting $N, a, b$ become infinite yields (97). Under independence,

$$
\begin{equation*}
E\left(\gamma_{n+1} \mid \mathfrak{F}_{n}\right)=E\left(E\left(\gamma_{n+1} \mid x_{n+1}\right) \mid \mathfrak{F}_{n}\right)=E\left(\gamma_{n+1}\right)=v_{n+1} . \tag{100}
\end{equation*}
$$

And from $\gamma_{n}=\max \left(x_{n}, E\left(\gamma_{n+1} \mid F_{n}\right)\right)=\max \left(x_{n}, v_{n+1}\right)$, we obtain (99) on taking expectations.

## 11. Remarks on the independent case

Theorem 10. Let the $\left\{x_{n}\right\}_{1}^{\infty}$ be independent with $\mathfrak{F}_{n}=B\left(x_{1}, \cdots, x_{n}\right)$. Set $s=$ first $n \geq 1$ such that $x_{n} \geq \gamma_{n}-\epsilon$ for $\epsilon>0$ ( $=\infty$ if no such $n$ exists). Then

$$
\begin{equation*}
v<\infty \Rightarrow P[s<\infty]=1, \tag{101}
\end{equation*}
$$

and if in addition $E\left(x_{s}\right)$ exists, then

$$
\begin{equation*}
E\left(x_{s}\right) \geq v-\epsilon . \tag{102}
\end{equation*}
$$

Proof. By lemma 8 and theorem 6 , since by (87)

$$
\begin{equation*}
\int_{[s>n]} E^{+}\left(\gamma_{n+1} \mid \mathfrak{F}_{n}\right)=\int_{[s>n]} v_{n+1}^{+}=v_{n+1}^{+} P[s>n] \leq v^{+} P[s>n] \rightarrow 0 . \tag{103}
\end{equation*}
$$

We remark that when $\epsilon=0$ the conditions $v<\infty, P[s<\infty]=1, E\left(x_{s}\right)$ exists, imply $E\left(x_{s}\right)=v$.

Theorem 11. Let the $\left\{x_{n}\right\}_{1}^{\infty}$ be independent with $\mathfrak{F}_{n}=@\left(x_{1}, \cdots, x_{n}\right)$, and let $\left\{\alpha_{n}\right\}_{1}^{\infty}$ be any sequence of r.v.'s such that $\alpha_{n}$ is measurable $\left(\mathfrak{F}_{n}\right)$ and $E\left(\alpha_{n}\right)$ exists, $n \geq 1$. If
(a) $\alpha_{n}=\max \left(x_{n}, E\left(\alpha_{n+1} \mid F_{n}\right)\right),(n \geq 1)$,
(b) $P\left(x_{n} \geq \alpha_{n}-\epsilon\right.$ i.o. $)=1$ for every $\epsilon>0$,
(c) $E\left(\alpha_{n+1} \mid \mathcal{F}_{n}\right)=c_{n}=$ constant, with $E\left(\alpha_{1}\right)=c_{1}<\infty$,
(d) $A^{+}$holds, or $\underset{n}{\liminf } E\left(x_{n}\right)>-\infty$,
then
(104)

$$
\alpha_{n} \leq \gamma_{n}
$$

$$
(n \geq 1)
$$

Proof. Define $A$ and $t$ as in theorem 7. Since

$$
\begin{equation*}
c_{n}=E\left\{\max \left(x_{n+1}, c_{n+1}\right) \mid \mathfrak{F}_{n}\right\} \geq c_{n+1} \tag{105}
\end{equation*}
$$

we have

$$
\begin{align*}
\int_{A} \alpha_{m} & =\int_{A[m \leq t \leq m+k]} \alpha_{t}+\int_{A[t>m+k]} \alpha_{m+k+1}  \tag{106}\\
& =\int_{A[m \leq t \leq m+k]} \alpha_{t}+\int_{A[t>m+k]} c_{m+k} \\
& \leq \int_{A[m \leq t \leq m+k]} \alpha_{t}+c_{1} P[t>m+k] .
\end{align*}
$$

Hence under $A^{+}$(or $A^{-}$),

$$
\begin{align*}
\int_{A} \alpha_{m} & \leq \liminf _{k \rightarrow \infty} \int_{A[m \leq t \leq m+k]} \alpha_{t} \leq \liminf _{k \rightarrow \infty} \int_{A[m \leq t \leq m+k]} x_{t}+\epsilon  \tag{107}\\
& \leq \liminf _{k \rightarrow \infty} \int_{A[m \leq t \leq m+k]} \gamma_{t}+\epsilon=\int_{A} \gamma_{t}+\epsilon \leq \int_{A} \gamma_{m}+\epsilon
\end{align*}
$$

by theorem 5 (c), so $\alpha_{m} \leq \gamma_{m}$. If the second part of (d) holds, then since $c_{n} \downarrow c$, say, where $c \geq \lim _{\inf _{n}} E\left(x_{n}\right)>-\infty$, and $x_{t} \geq c_{t}-\epsilon \geq c-\epsilon$, it follows that $E\left(x_{i}^{-}\right)<\infty$, so theorem $5(\mathrm{~d})$ yields the same conclusion.

Remarks. 1. Lemmas 2 and 3 are slight extensions of lemmas 1 and 2 of [2].
2. Theorem 1 has been proved independently by G. Haggstrom [4] when $E\left|x_{n}\right|<\infty$ and $E\left(\sup _{n} x_{n}^{+}\right)<\infty$, as have theorem 4, corollary 1(c) of theorem 5 under $A^{+}$, and the corollary of theorem 6. The latter was also proved by J. L. Snell [5].
3. We are greatly indebted to Mr. D. Siegmund for improvements in the statement and proof of many of our results. In particular, theorem 9 is largely due to him.
